

Trous maculaires

Ramin Tadayoni

TM primaire

- Terminologie : Déhiscences rondes centro-fovéolaires primaire
 - + jadis ses stades évolutifs
- Historique :
 - Première description : Knapp 1869
 - Description ophtalmoscopique : Noyes 1871
 - « Trou maculaire » : Ogilvie

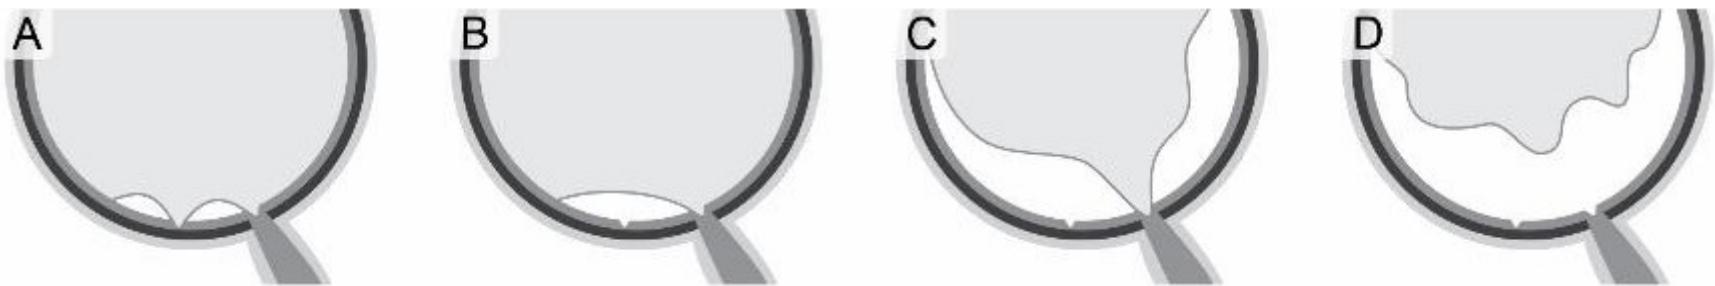

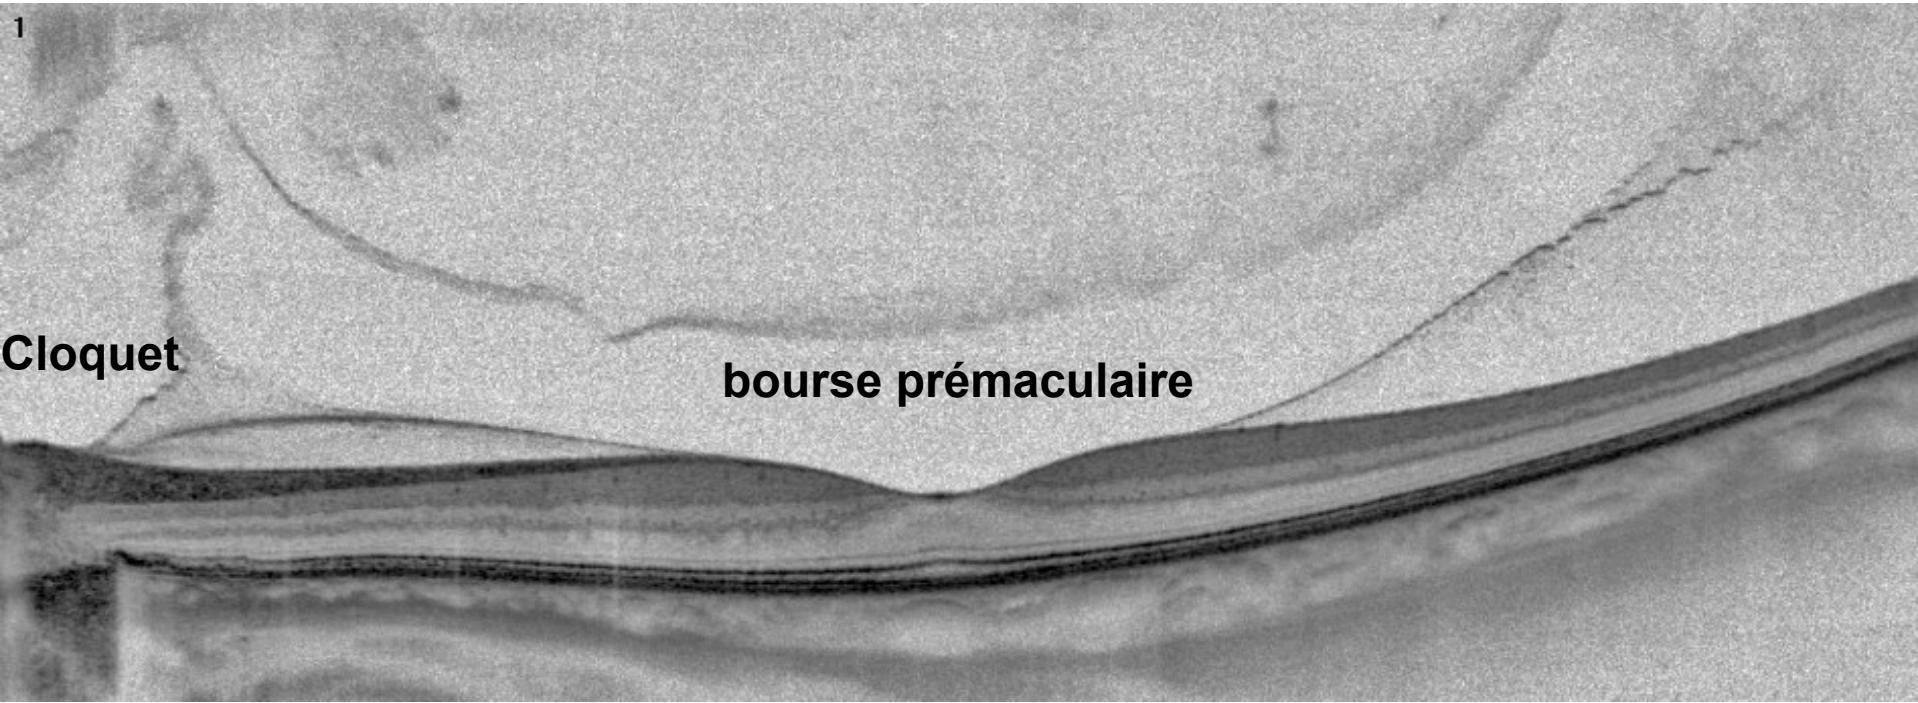

Epidémiologie

- Incidence annuelle : 7.8 /100 000
 - France : environ 5-6000 cas / an
- 2/3 des cas chez la femme
- Souvent après 60 ans
- bilatéraux dans 10 % des cas

PHYSIOPATHOLOGIE

Vitré et DPV normal

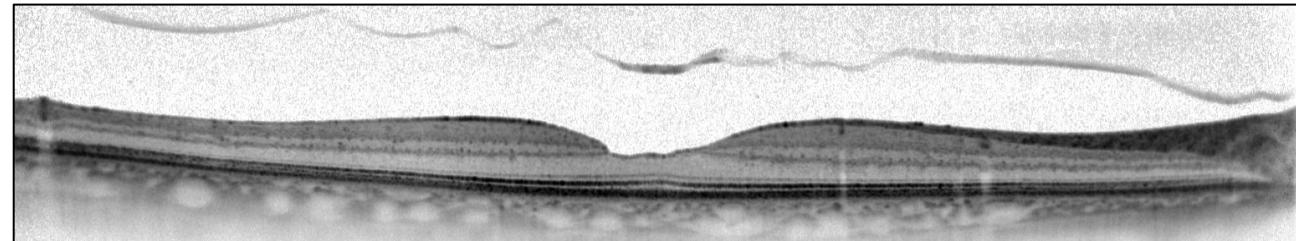

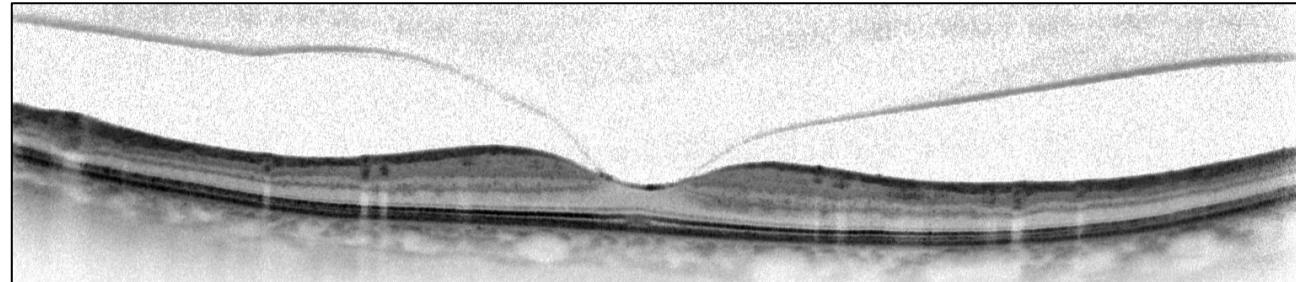

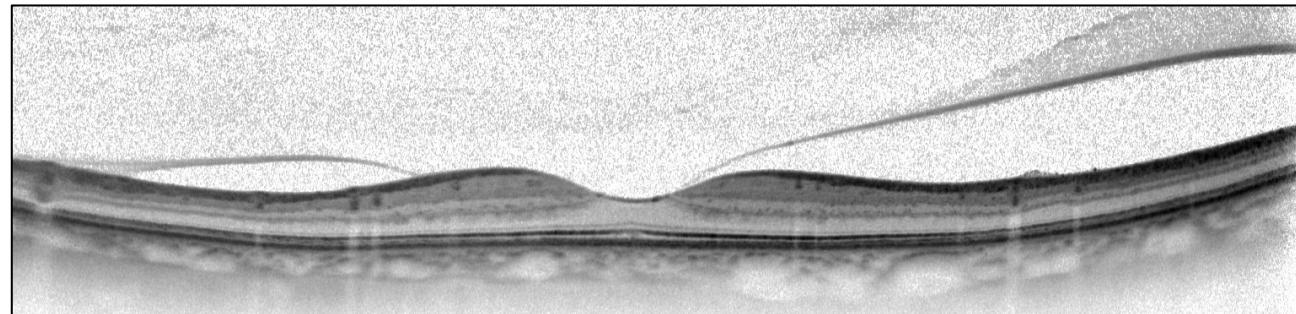

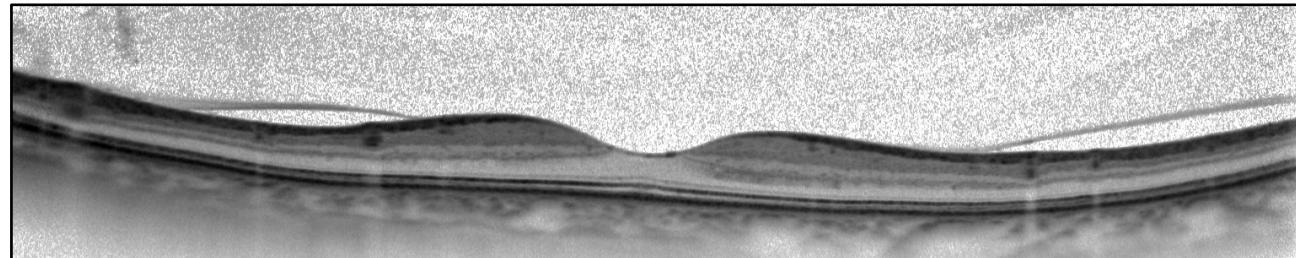

The stages of PVD as described by Johnson, Sebag, Gaudric et al, and Uchino et al.

DPV / OCT

Uchino et al, *Arch Ophthalmol* 2001, showed that :

- PVD begins around the macula
- Before 50 y, 60 % of normal eyes have some degree of partial PVD

No symptom without OCT changes...

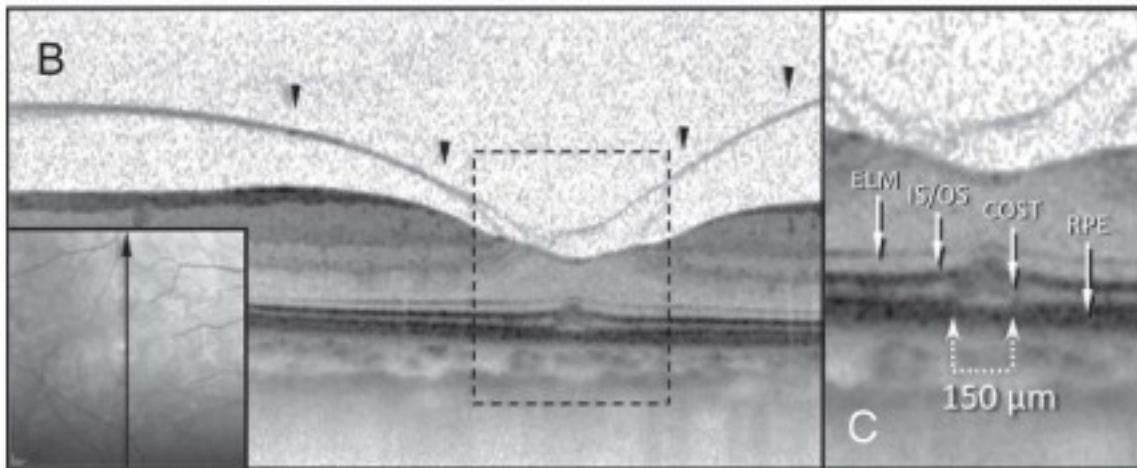

Initial Stages of Posterior Vitreous Detachment
in Healthy Eyes of Older Persons Evaluated
by Optical Coherence Tomography

Arch Ophthalmol. 2001;119:1475-1479

Macular hole formation

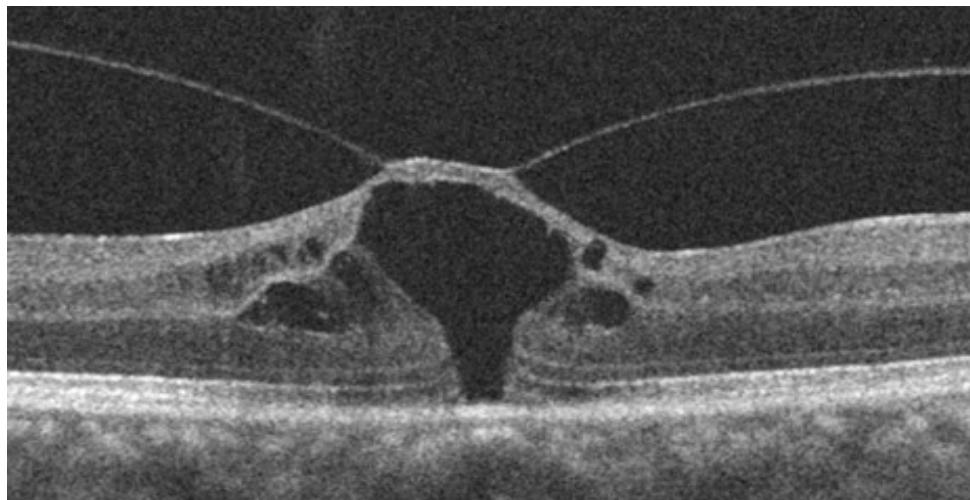

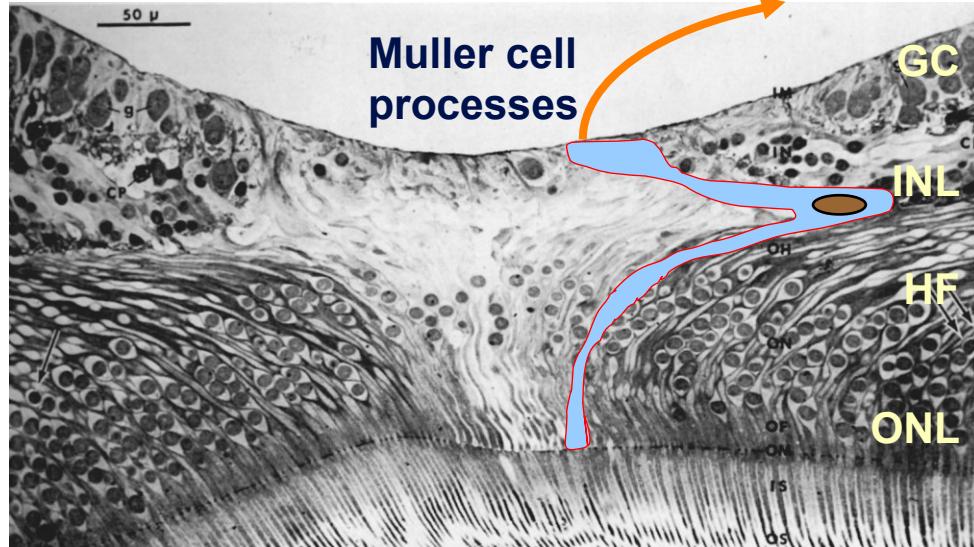

- Now, SD OCT, improved by image summation, have shown very discrete intraretinal foveal anomalies
 - which could be called Stage Zero MH (Chan & Duker 2004)

From Takahashi
et al Retina 2011

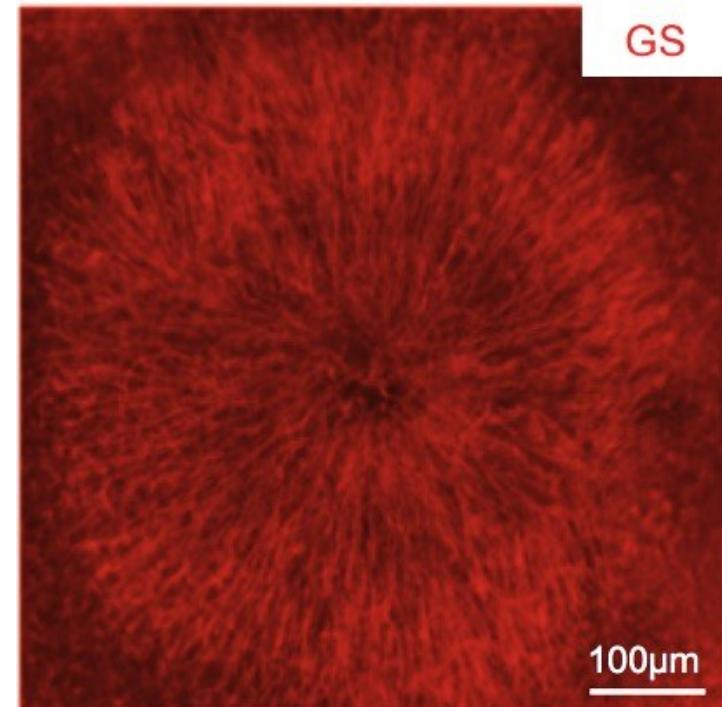

- We have looked at 250 asymptomatic fellow eyes of MH, examined with SD OCT in high resolution mode
 - 23% subtle changes in the foveola

Formation d'un TM : bases anatomiques

Œil adelphe de TM

DIAGNOSTIC POSITIF

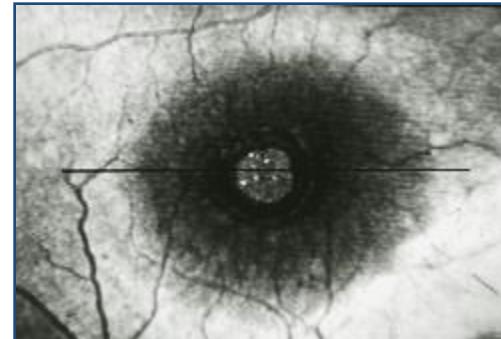

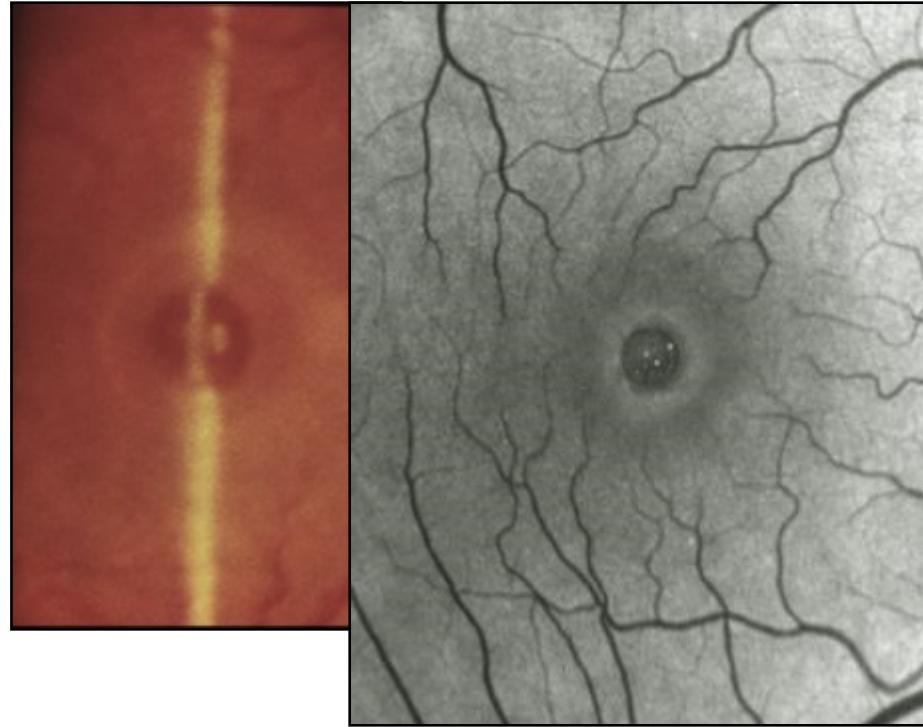

Symptomatologie

- BAV
- Microscotome central (-)
- Métamorphopsies
- Parfois passée inaperçue (œil non dominant)

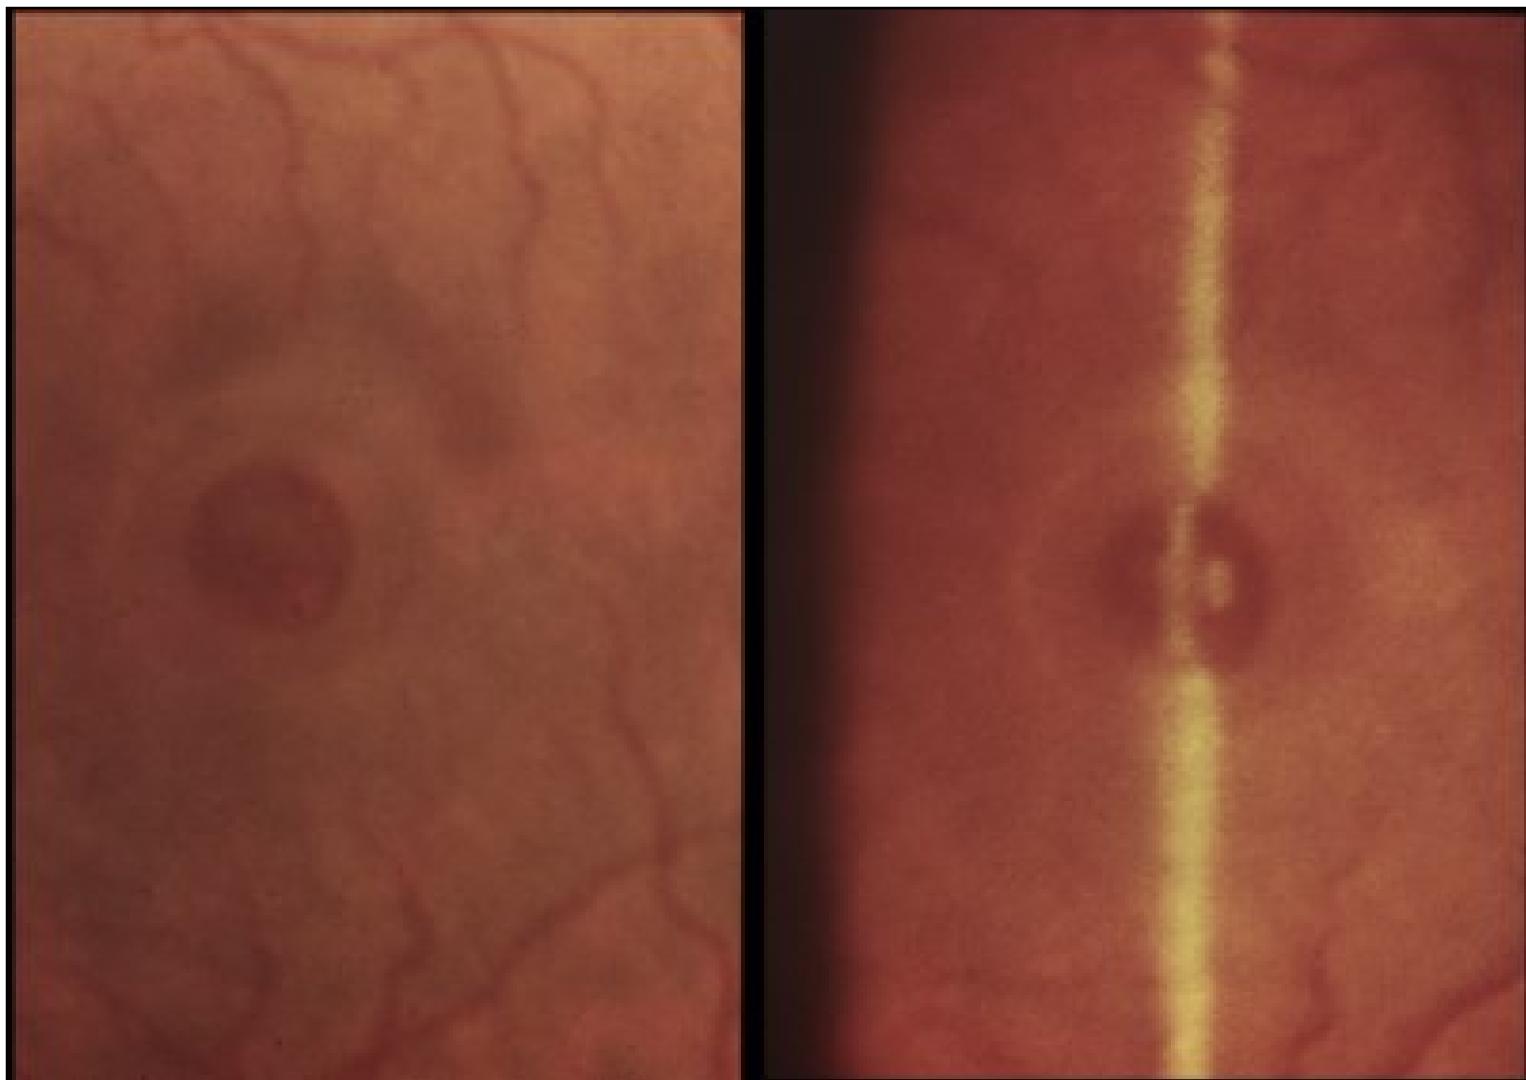

Clinique

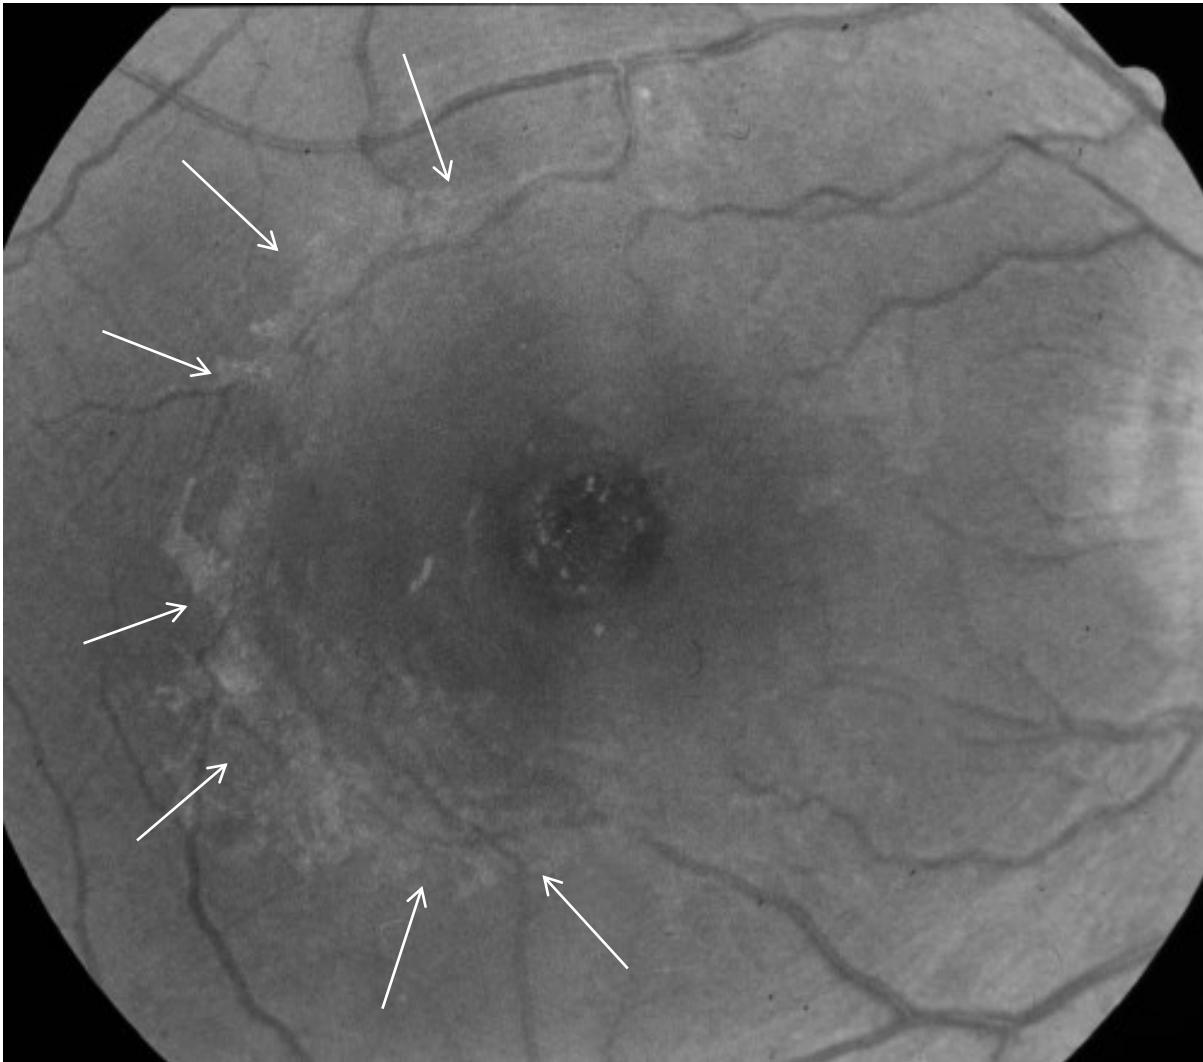

- Mesure AV
- Examen du FO
 - trou typique de pleine épaisseur
 - Dépôts blancs au fond du trou
 - Entouré d' un anneau de soulèvement rétinien
 - Dégénérescence microkystique
 - Stade DPV variable
 - Avec ou sans opercule
 - Parfois MEM (non contractile)
- Test de Watzke (historique?)

Examen FO

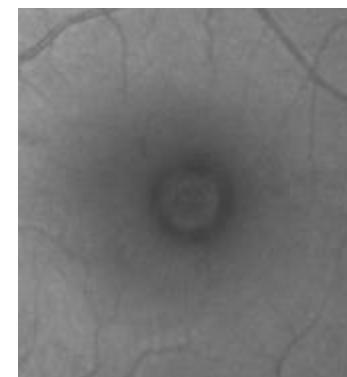

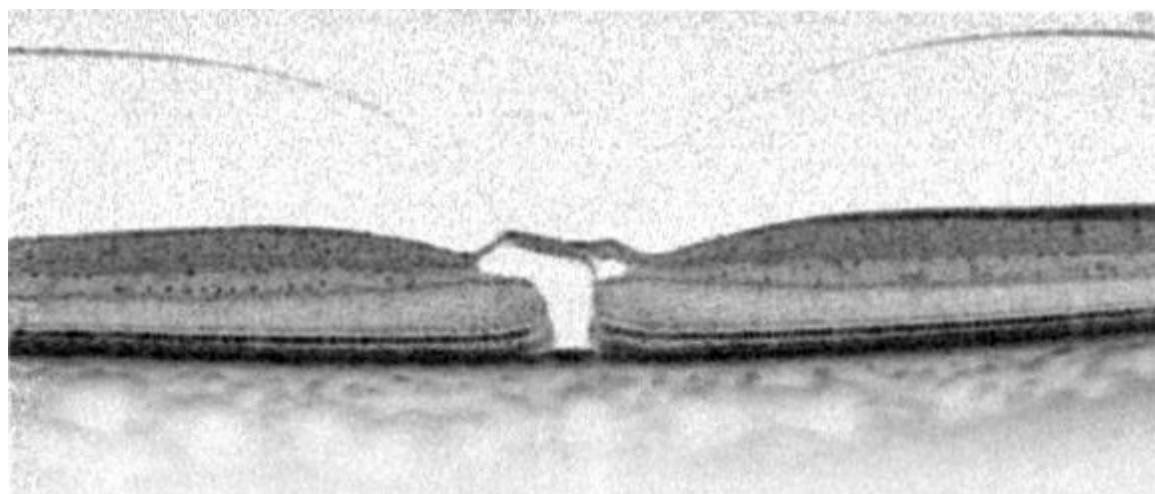

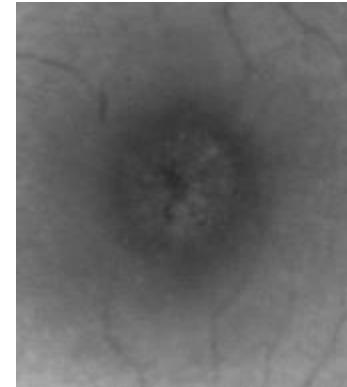

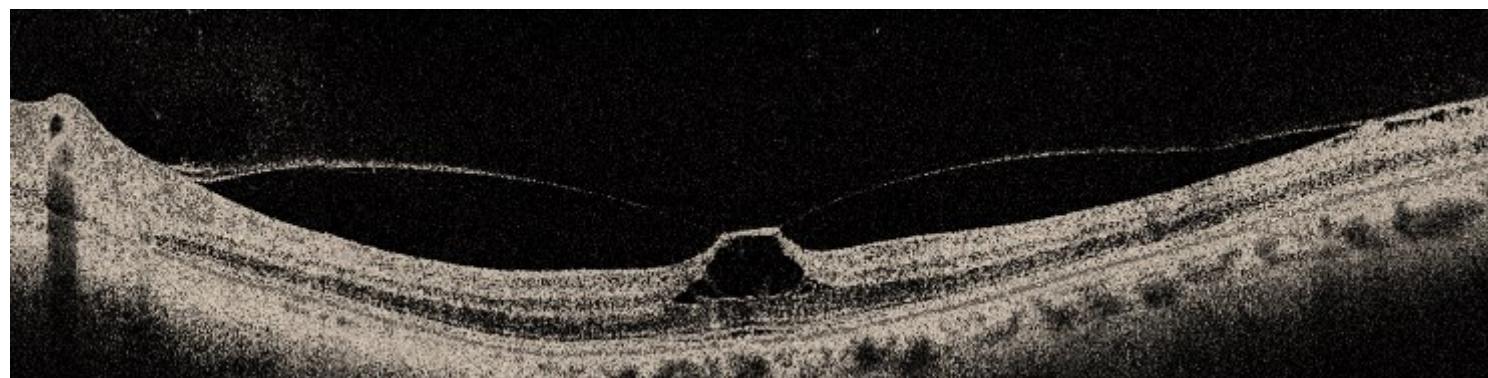

Prolifération peri-TM

HOPITAL LARIBOISIÈRE

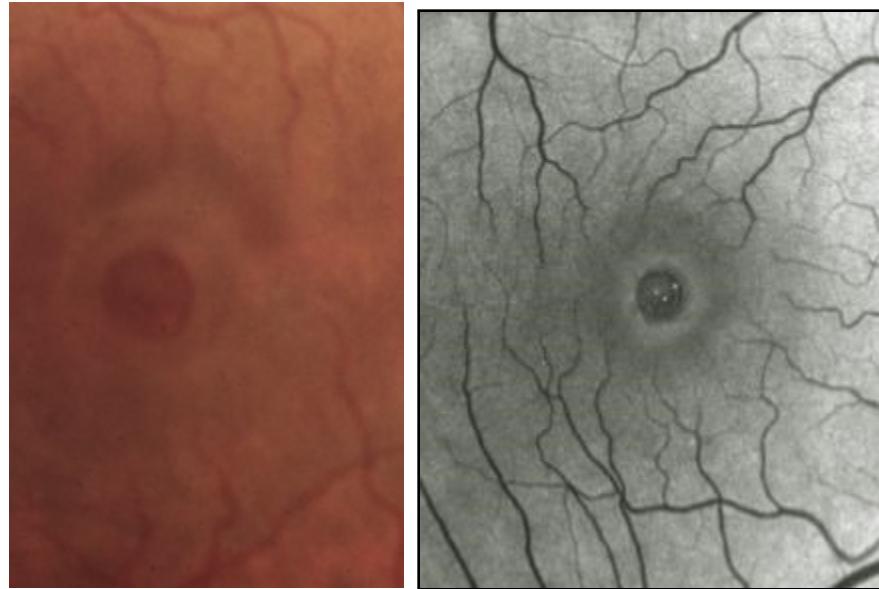

Diagnostics difficiles

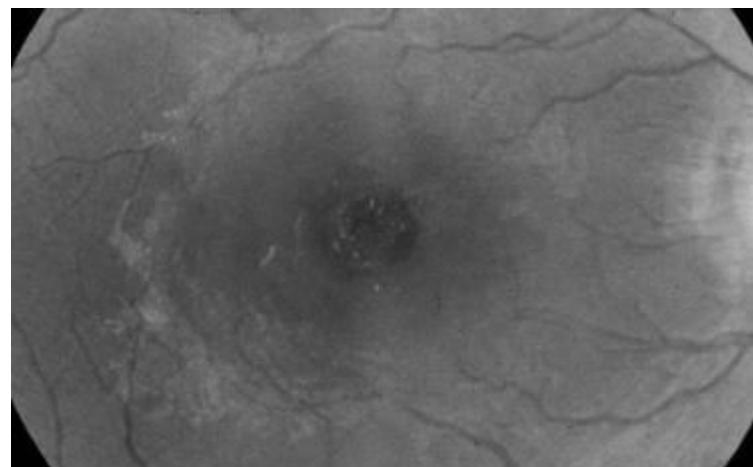

EXAMENS COMPLÉMENTAIRES

Diagnostic différentiel

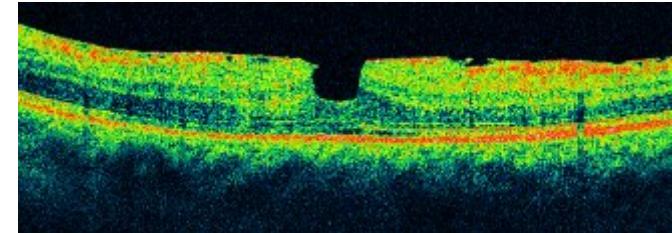

L'OCT permet de faire la différence entre TM, trou lamellaire et pseudo-trou

Trou maculaire

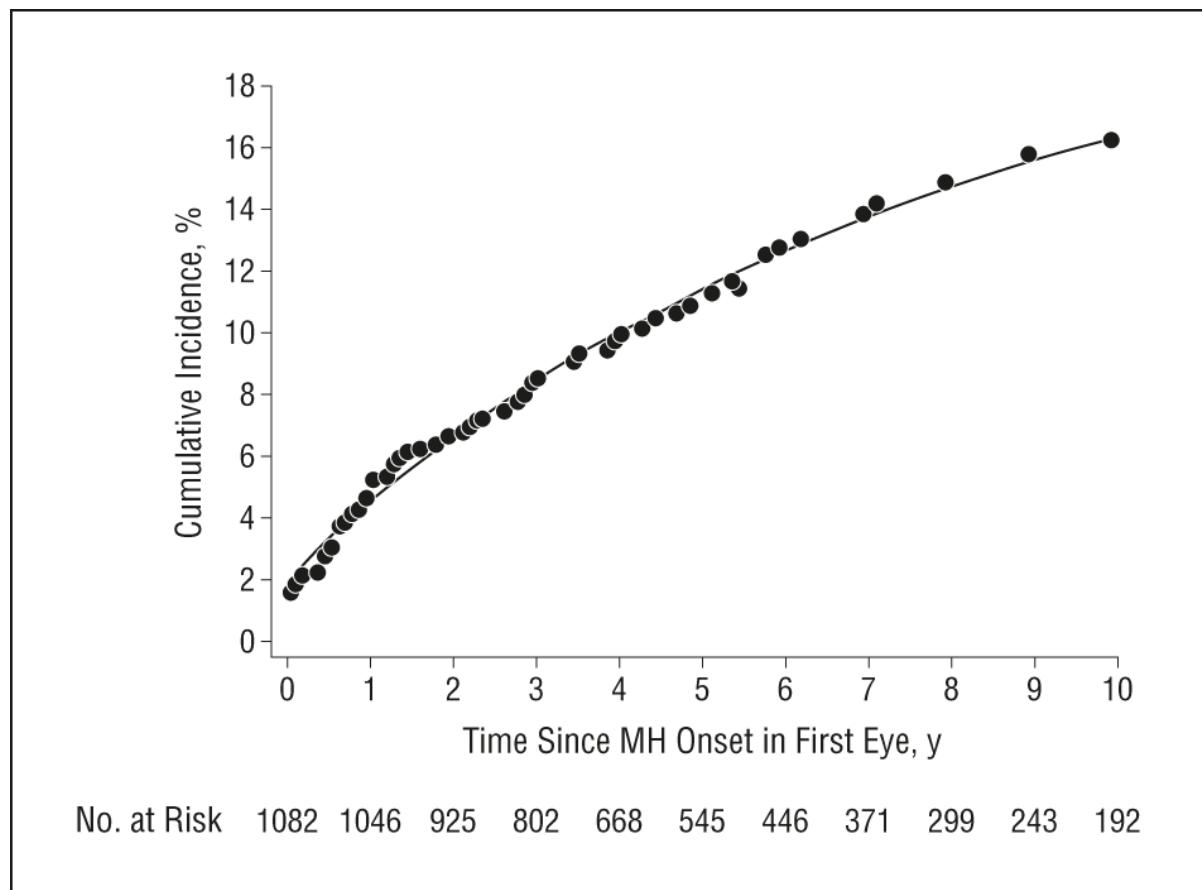

Trou lamellaire

Pseudo-trou

Risque de TM dans l'œil adelphe

- 1082 patients
- 49 mois de suivi
- TM 11,3%
- estimation
 - 11,6% à 5ans
 - 16,7% à 10 ans

Kumagai K, Ogino N, Hangai M, Larson E. Percentage of fellow eyes that develop full-thickness macular hole in patients with unilateral macular hole.
Arch Ophthalmol. 2012 Mar;130(3):393–4.

RISQUE POUR L'AUTRE ŒIL

- Séparation vitréo fovéolaire en OCT: Peu de risque
- Séparation vitréo-fovélolaire incomplète : 50% de risque de Trou Maculaire (Chan et Duker 2004)
- Membrane épimaculaire: Peu de risque de trou
- Trou lamellaire : Peu de risque

Author	Year	Nb	F-up (m)	MH%	Comments
Haouchine	2001	22	9	13,6%	All eyes with PPVD and foveal changes
Chan	2004	12	41	42%	With PPVD (12/94) With no vitrofoveal adhesion (67/94) 9%
Niwa	2005	58	24	5,2%	All eyes with PPVD
Takahashi	2011	42	18	12%	With PPVD : 12% With foveal changes : 50%

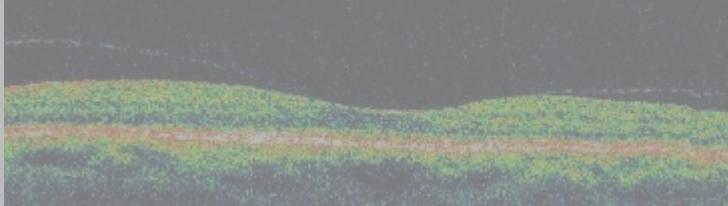

CLASSIFICATIONS

Gass's Classification

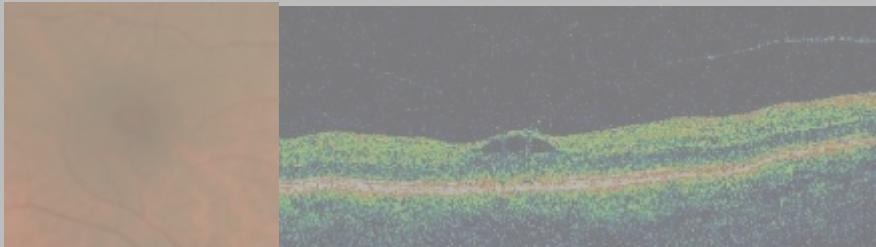

- Stages :
 - Stage 1 A and B
 - Stage 2: $< 400 \mu\text{m}$ + no PVD from the macula
 - Stage 3: $> 400 \mu\text{m}$ +/- pseudo-operculum + no complet PVD
 - Stage 4: complet PVD
- Problems:
 - What about a MH $< 400 \mu\text{m}$ and a pseudo-operculum (PWD from the macula)?
 - What about a MH $< 400 \mu\text{m}$ + complet PVD?

Size and vitreomacular attachment of primary full-thickness macular holes

Elise Philippakis, Franck Amouyal, Aude Couturier, Elise Boulanger-Scemama, Alain Gaudric, Ramin Tadayoni

International Consensus System for Classification of Diseases of the Vitreomacular Interface

<i>Classification</i>	<i>Subclassification</i>
Vitreomacular Adhesion (VMA)	<ul style="list-style-type: none">• Size: focal ($\leq 1500 \mu\text{m}$) or broad ($> 1500 \mu\text{m}$)• Isolated or concurrent
Vitreomacular Traction (VMT)	<ul style="list-style-type: none">• Size: focal ($\leq 1500 \mu\text{m}$) or broad ($> 1500 \mu\text{m}$)• Isolated or concurrent
Full-thickness Macular Hole (FTMH)	<ul style="list-style-type: none">• Size: small ($\leq 250 \mu\text{m}$), medium ($> 250 \mu\text{m}$ to $\leq 400 \mu\text{m}$), or large ($> 400 \mu\text{m}$)• Status of vitreous: with or without VMT• Cause: primary or secondary

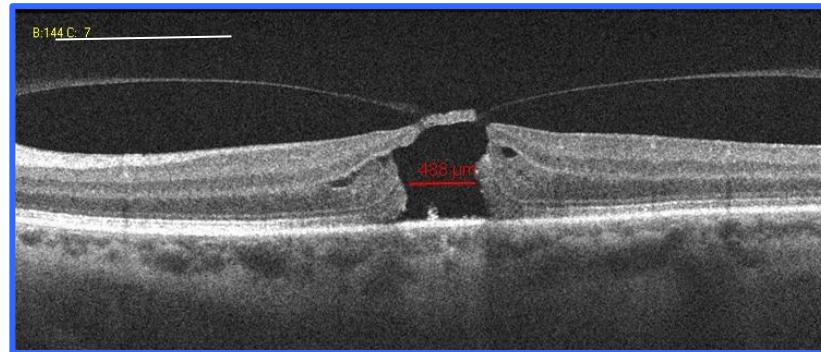

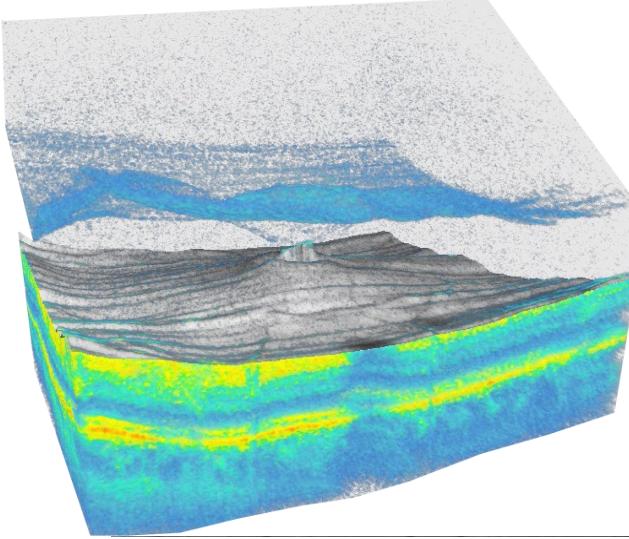

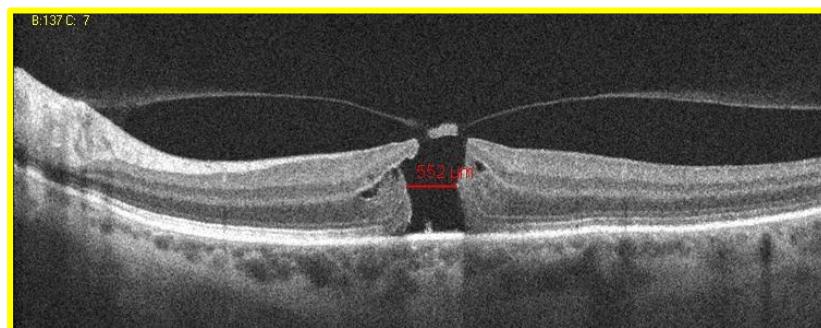

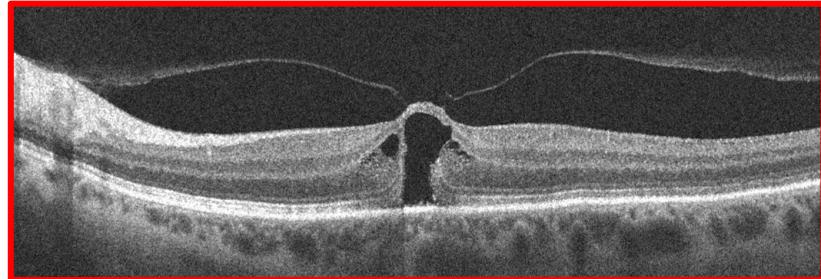

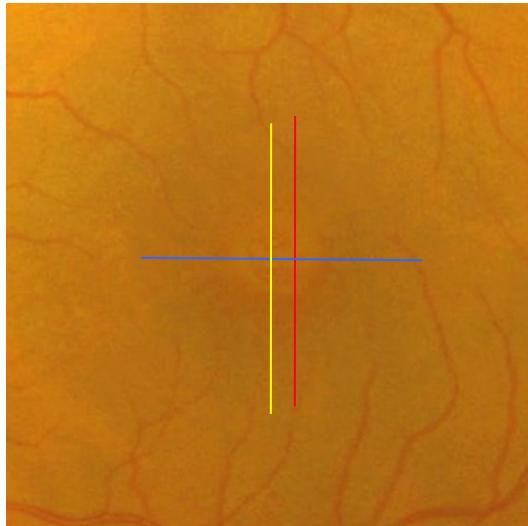

TM primaire / secondaire, petit / moyen /grand, avec ou sans TVM (en option: ± DPV complet si sans TVM)

- TM idiopathique	- TM primaire
- TM non idiopathique	- TM secondaire

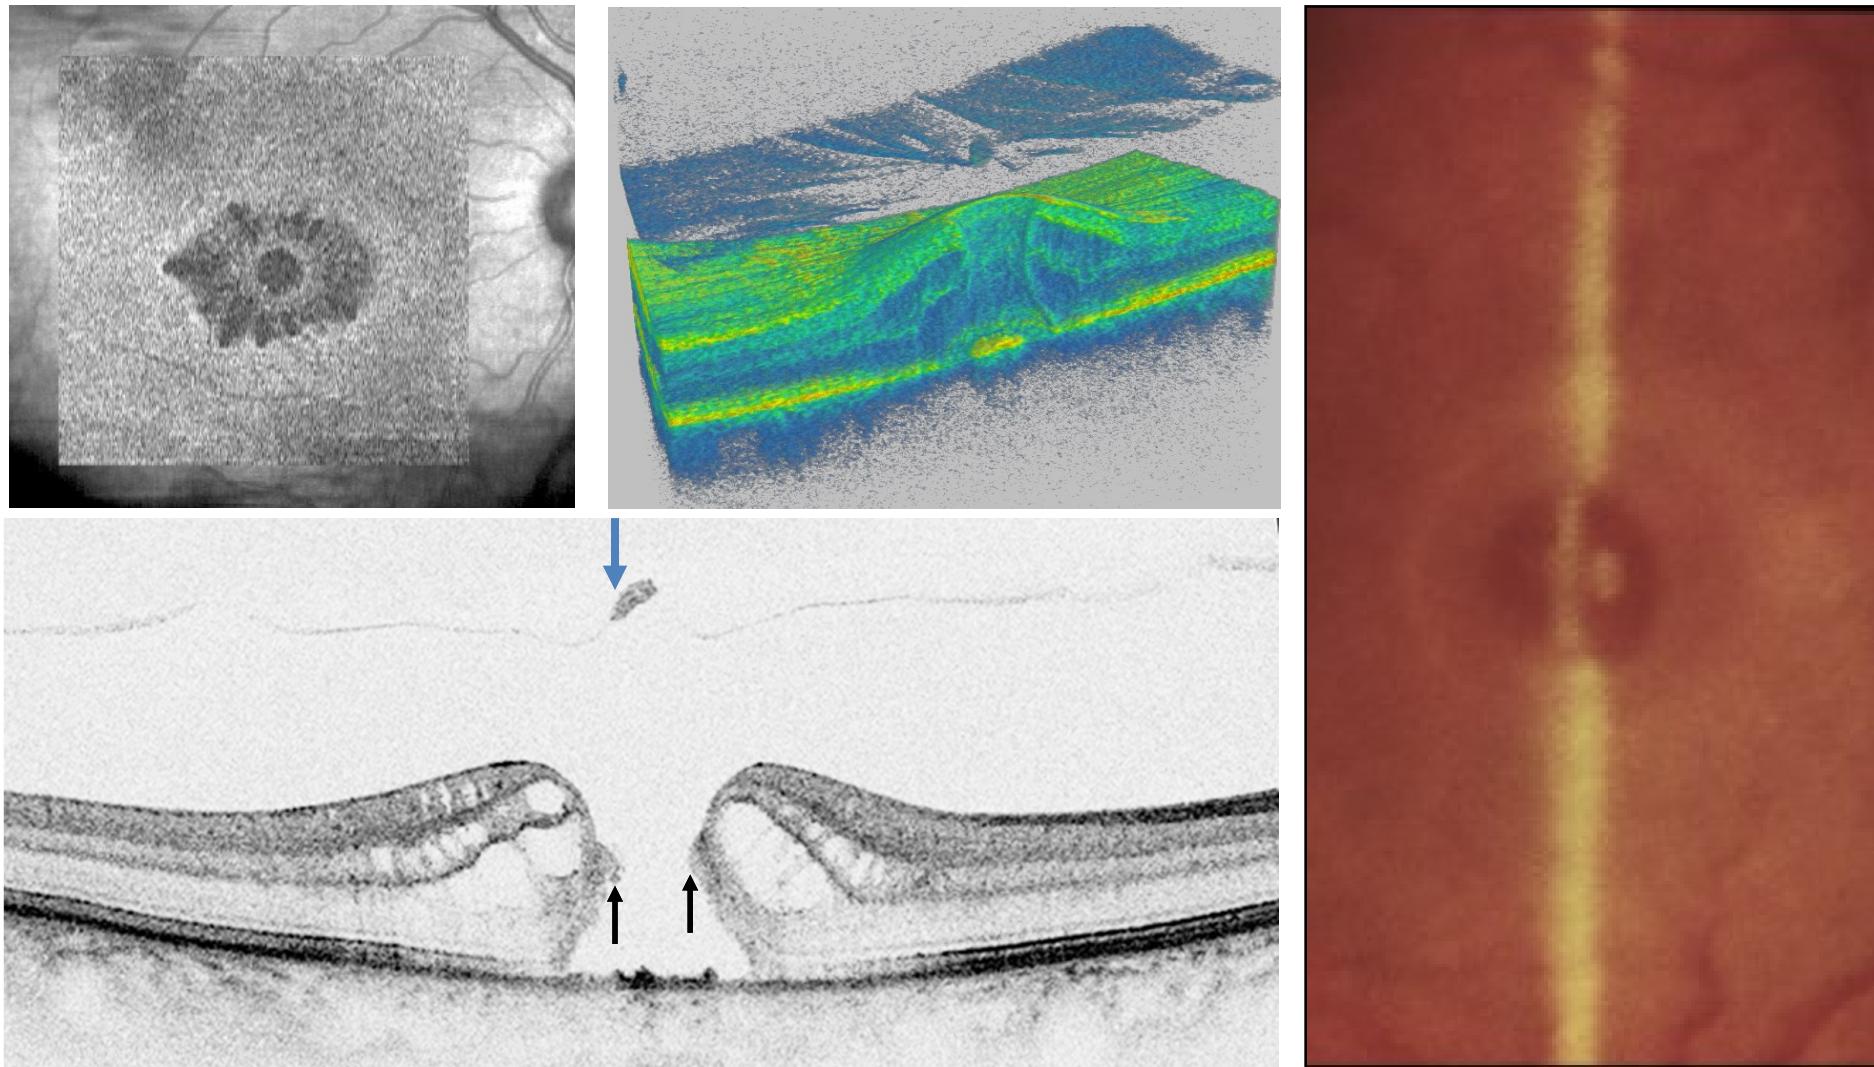

Etiologie du TM:

- dans la plupart des cas, le TM est idiopathique, c'est-à-dire simplement secondaires à une traction fovéolaire anormale. On parle, dans la nouvelle classification, de TM primaires.
- TM secondaire = autres causes : traumatisme à globe fermé, après la rupture de la paroi interne d'un kyste dans les cas d'œdème maculaire cystoïde, myopie forte avec staphylomes (TM sans DPV)...

TM avec TVM

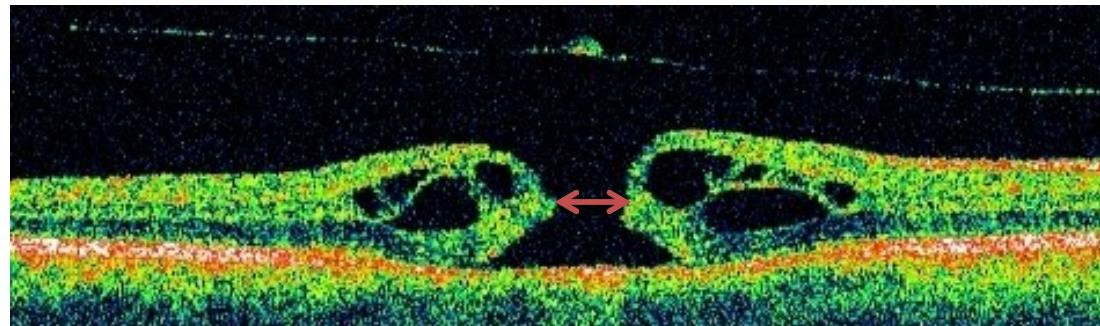

TM de pleine épaisseur, sans TVM

TM primaire / secondaire, petit / moyen /grand, avec ou sans TVM
(en option: \pm DPV complet si sans TVM)

- TM \leq 250 μm	- TM petit
- 250 < TM \leq 400 μm	- TM moyen
- TM $>$ 400 μm	- TM grand

D10

Fermeture pneumatique

- Injection d'une petite bulle de gaz pour libérer la traction et fermer le TM
 - Encore discuté (R/B) pour les TVM
 - Pas suffisamment de preuve pour les TM

La chirurgie

- Ambulatoire
- Anesthésie locorégionale
- Trans conjonctivale
 - Œil souvent blanc et indolore
- Il n'y a que la présence du gaz qui gène le patient pendant quelque temps : interdiction altitude!

Anesthésie plus légère

RESEARCH ARTICLE

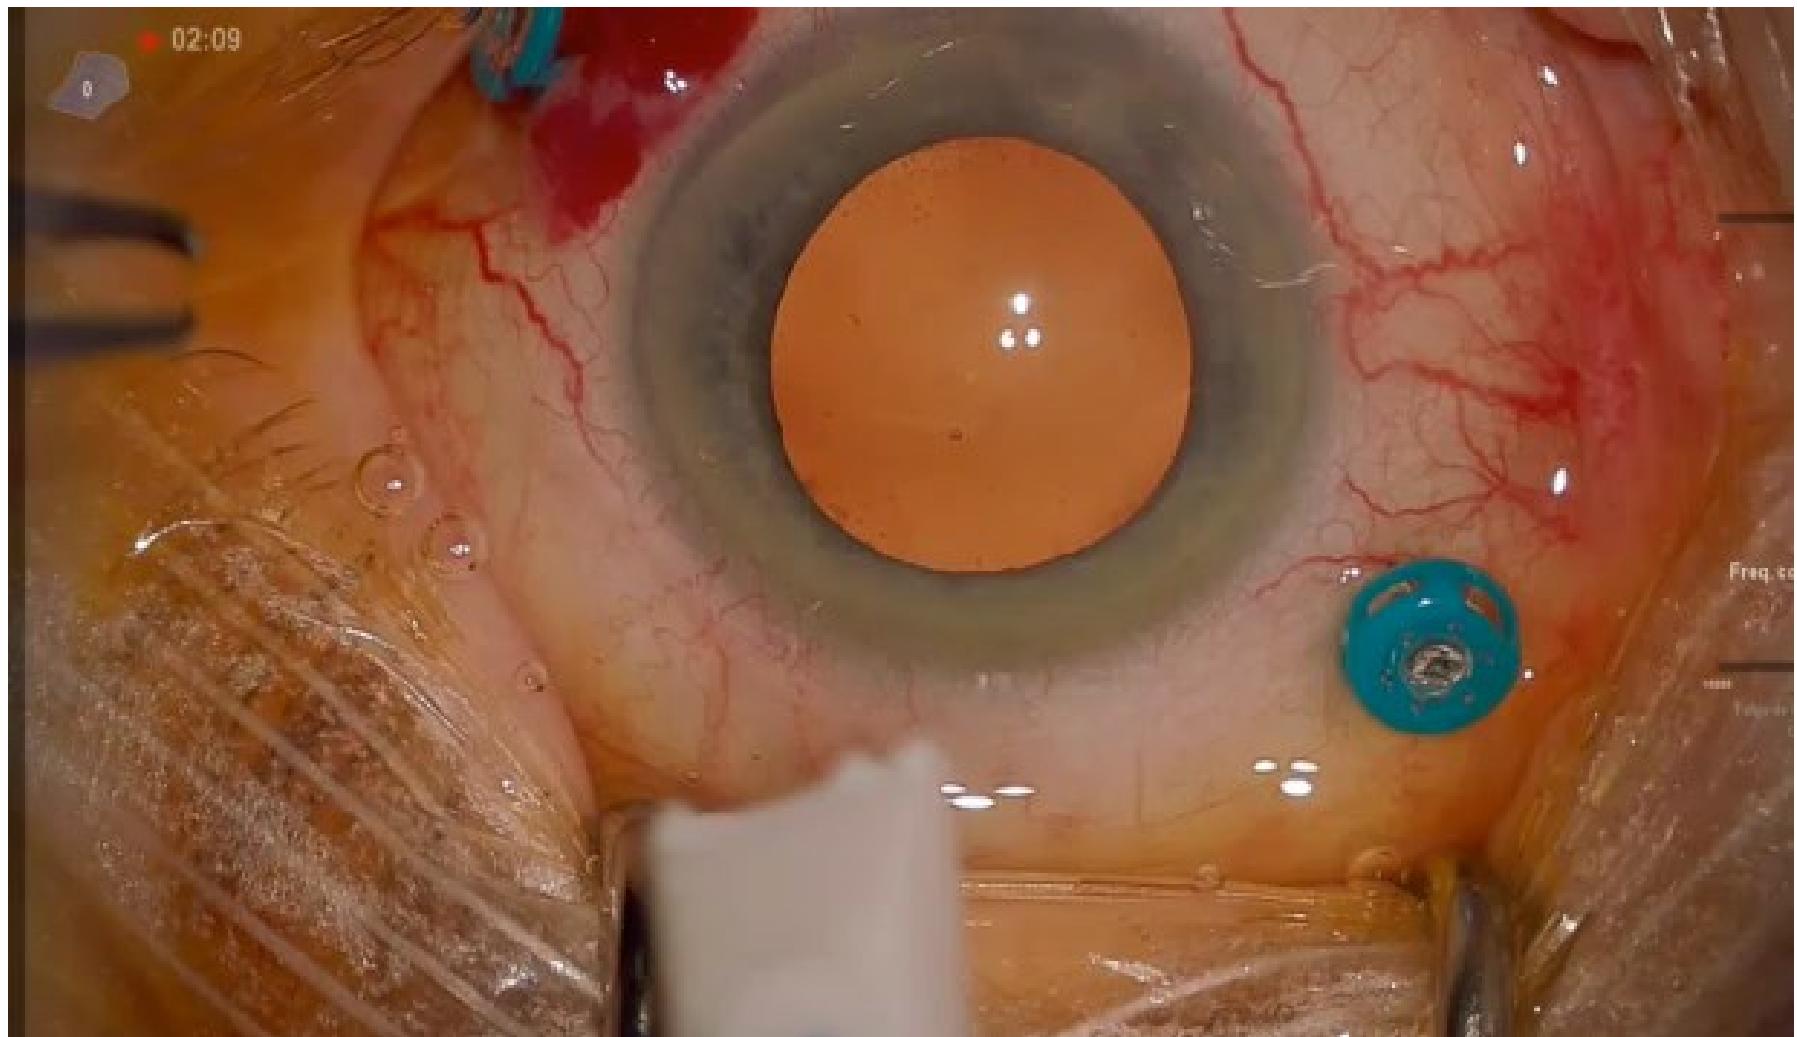

Pain during pars plana vitrectomy following sub-Tenon versus peribulbar anesthesia: A randomized trial

Jefferson A. S. Ribeiro^{1,2*}, Daniel S. Ribeiro², Ingrid U. Scott^{3,4}, João Abrão⁵,
Rodrigo Jorge²

Conclusion

In this study of patients who underwent PPV for MH or ERM, topical followed by sub-Tenon anesthesia was more effective in controlling pain during the whole vitrectomy procedure than peribulbar anesthesia. Compared to peribulbar anesthesia which is administered with a sharp needle, sub-Tenon anesthesia administered with a blunt cannula may be associated with a reduced risk of such adverse events as globe perforation, retrobulbar hemorrhage, and inadvertent injection of anesthesia into the optic nerve sheath.

Absence d'Akinésie : TM sous topique

MH Surgery Principles

1. Relieve any resistance to closure

- 3 Peelings

1. To reduce its size: “dry” the MH

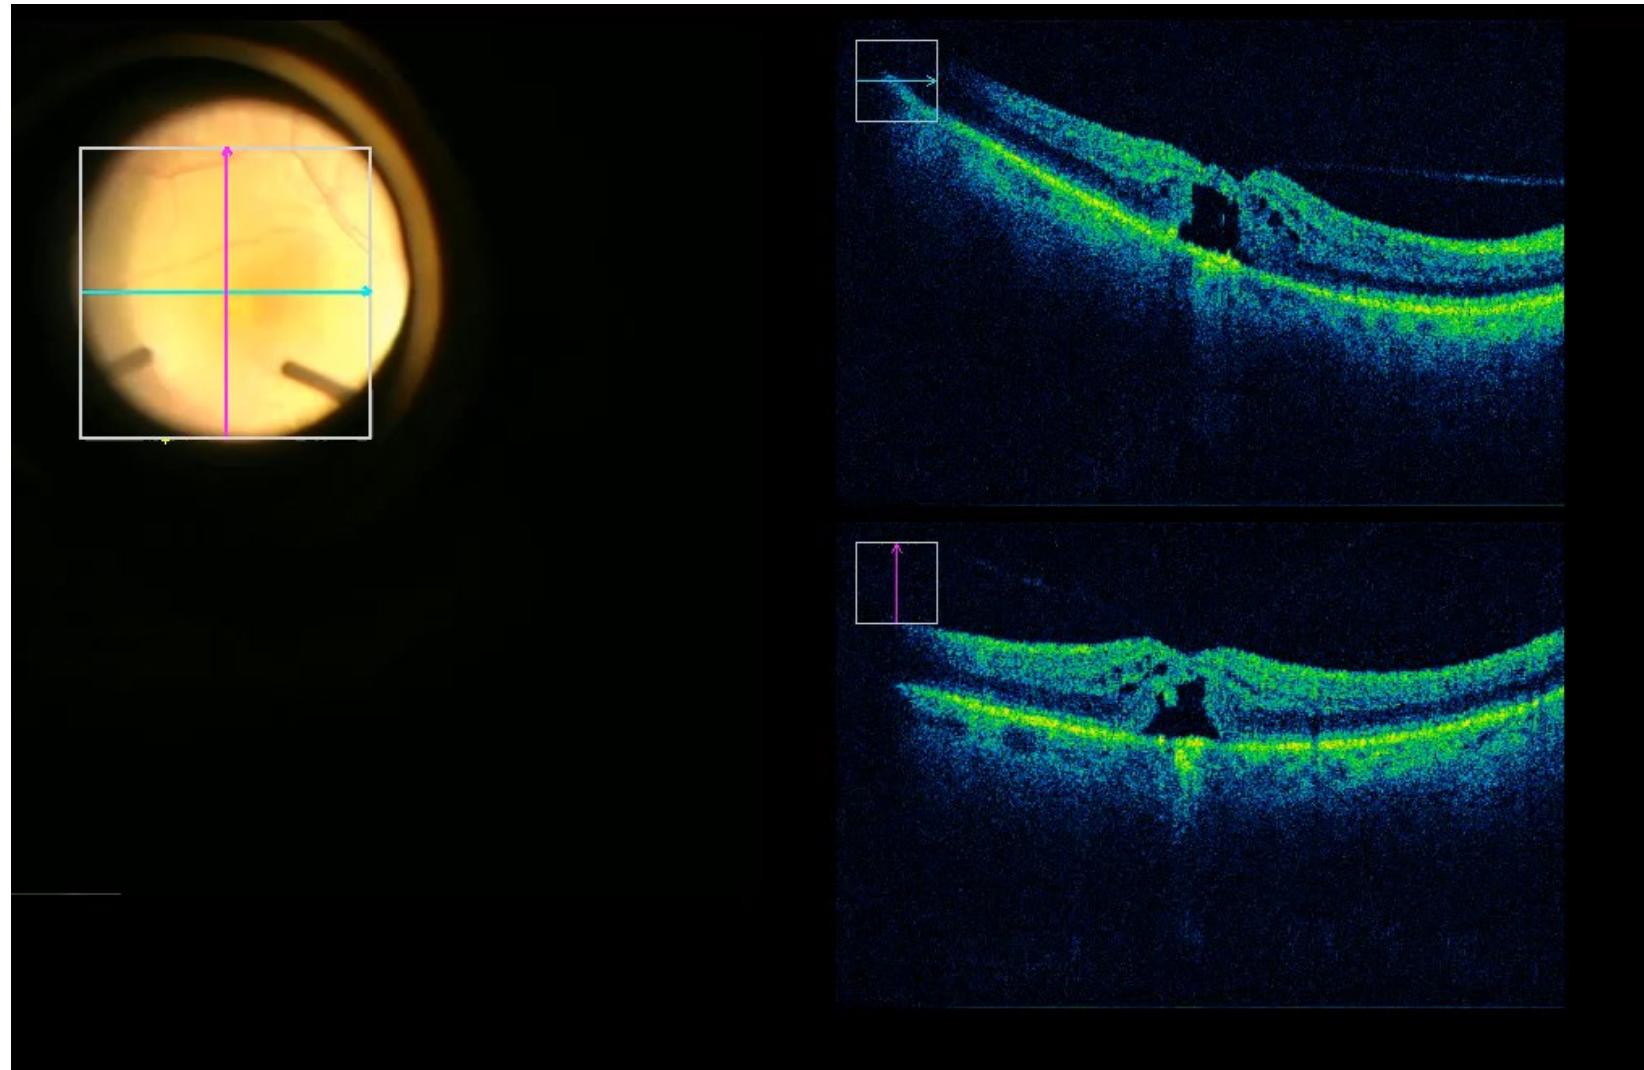

- FAX

1. Help scar formation: tamponade

- Gas

- Face-down positioning

Chirurgie d'un TM en OCT per-op

Position face vers le sol

The process of closure of experimental retinal holes in rabbit eyes

T Yamana ¹, M Kita, S Ozaki, A Negi, Y Honda

- In the gas-injected eyes, the retinal holes were ophthalmoscopically closed by 7 days after the surgery.
 - area of retinal defect was covered with cells which were positive for cytokeratin 18 and GFAP: glial and RPE cells might play an important role
- In the eyes without gas tamponade, the retinal holes did not close during the observation period.

Intraocular Tamponade Choice with Vitrectomy and Internal Limiting Membrane Peeling for Idiopathic Macular Hole

A Systematic Review and Meta-analysis

Nikolaos Dervenis, MD, PhD,^{1,2} Panagiotis Dervenis, MD, MSc,⁴ Teresa Sandinha, MD, FRCSEd (Ophth),^{3,5} Declan C. Murphy, MBBS, MRes,^{6,7} David H. Steel, MD, FRCOphth^{5,6,7}

Conclusion: The current evidence base for tamponade selection with vitrectomy and ILM peeling for full-thickness macular hole has several major limitations. Further appropriately designed studies are needed to guide tamponade selection. *Ophthalmology Retina* 2022;6:457-468 © 2022 by the American Academy of

Pars plana vitrectomy with silicone oil tamponade for primary and secondary macular hole closure: Is it still a useful procedure?

Janusz Pieczynski ^{1 2}, Patrycja Kuklo ^{1 2}, Andrzej Grzybowski ^{1 3}

Conclusion: There are reports on good efficacy of silicone oil tamponade for primary and recurrent macular hole closure. Anatomical closure and visual acuity rates in pars plana vitrectomy with silicone oil and with gas filling are comparable. Gas tamponade seems to be safer and needs no more surgery. Postoperative complications in both methods are similar, but all patients with silicone oil filling need to undergo a reoperation to have the silicone removed. There are also other surgical techniques for

GAS-FOVEAL CONTACT

A New Approach to Evaluating Positioning Regimens in Macular Hole Surgery

MARK ALBERTI, MD, MORTEN LA COUR, MD, DMS

CAS-FOVEAL CONTACT • ALBERTI AND LA COUR

919

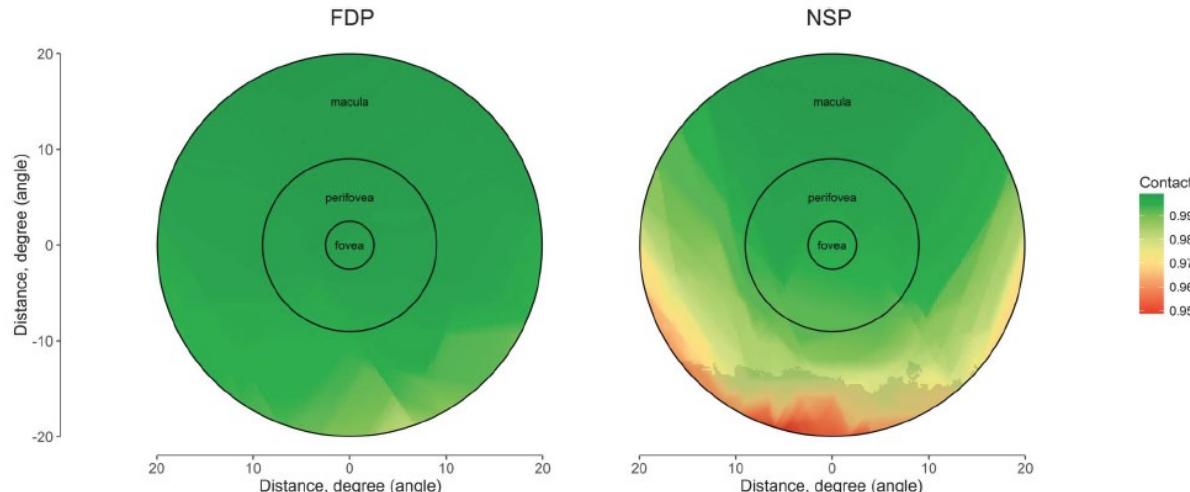

Fig. 4. Gas-macular contact in a 20° radius from the fovea is visualized above in a heatmap visualization by aggregating median values for 31,417 different macular locations. Gas-macular contact in the inferior macular area of the NSP group is significantly worse than in the FDP group (visualized in gray shading). The difference is significant at 13.2° from the fovea. The selected radii for the fovea, perifovea, and macular areas are 2.5°, 9°, and 20°, respectively.

Facedown Positioning Following Surgery for Large Full-Thickness Macular Hole

A Multicenter Randomized Clinical Trial

Saruban Pasu, MBBS, MD,^{1,2,3} Lauren Bell, BSc,^{4,5} Zohra Zenasni, MSquic,^{4,5} Doris Lanz, MSc,^{4,5}

Irene A Simmonds, BA, MA, BSc,^{4,5} Ann Thompson, MSc,^{4,5} David Yorston, MBChB,⁶ D. Alistair H. Laidlaw,

MBBS,⁷ Catey Bunce, MSc, DSc,^{1,2,8} Richard Hooper, PhD,^{4,5} and James W. B. Bainbridge, MA, MBBChir^{1,2,3},

for the Positioning In Macular Hole Surgery (PIMS) Study Group

- A total of 185 participants
- MH of at least 400 µm and a duration of fewer than 12 months.
- Peeling of the internal limiting membrane
- Macular hole closure was observed in 90 (**85.6%**) who were advised to position face forward
- 88 (**95.5%**) advised to position facedown (adjusted odds ratio, 3.15; 95% CI, 0.87-11.41; $P = .08$)
- ...

Conclusions and Relevance

The results do not prove that facedown positioning following surgery is more likely to close large macular holes compared with facing forward but do support the possibility that visual acuity outcomes may be superior.

DIFFERENCES IN ANATOMICAL AND VISUAL OUTCOMES AMONG THREE INTERNAL LIMITING MEMBRANE TECHNIQUES TREATING EXTRA-LARGE IDIOPATHIC MACULAR HOLES

Lingzi Liu^{1 2}, Yanping Yu^{1 2}, Xiaohan Yang^{1 2}, Zengyi Wang^{1 2}, Biying Qi^{1 2}, Ke Zhang^{1 2}, Xijin Wu^{1 2}, Xinbo Wang^{1 2}, Wu Liu^{1 2}

Methods: Patients with idiopathic macular holes (minimum linear diameter $\geq 650 \mu\text{m}$) were divided into peeling group, insertion group, and cover group. The initial closure rate, final length of external limiting membrane and ellipsoid zone recovery, and best-corrected visual acuity were evaluated.

Conclusion: For extra-large idiopathic macular holes, cover technique surpasses internal limiting membrane peeling technique in closure rate and outperforms insertion technique in anatomical and functional recovery, whereas insertion technique may adversely affect the recovery of foveal microstructure and best-corrected visual acuity.

[Sci Rep.](#) 2022 Jan 14;12(1):731. doi: 10.1038/s41598-021-04739-x.

Effect of inverted internal limiting membrane flap technique on small- medium size macular holes

Kanako Yamada ¹, Akio Oishi ², Mao Kusano ¹, Hirofumi Kinoshita ¹, Eiko Tsuiki ¹,
Takashi Kitaoka ¹

- The result suggested that inverted ILM flap technique does not have additional benefits for small- medium size MHs and may delay recovery of retinal integrity.

At least to use MH size to decide...

- Excellent prognosis:
 - Up to 400 without posturing or peeling
 - Up to 650 microns with ILM peeling
- Our data even suggest up to 800 microns with ILM peeling + posturing
- More invasive technics should show benefit before being used...

Ophthalmology Volume 106, Number 5, May 1999

Anatomic Success Rate

The success rate at 1 month after surgery was 52 of 53 (98%; 95% exact confidence interval, 0.90–1.00) in the platelet group and 47 of 57 (82%; 95% exact confidence interval, 0.70–0.91) in the control group ($P = 0.009$, Fisher's exact test; relative risk, 1.19; 95% confidence interval, 1.05–1.35). When adjusting for baseline covariates (e.g., age, hole duration, and visual acuity) by a logistic model, the two treatment groups remained significantly different ($P = 0.02$). Before the 6-month visit, three reopenings (3%) of the macular hole occurred: two in the platelet group and one in the control group. Therefore, the success rate at 6 months was 50 (94%) of 53 in the platelet group and 46 (81%) of 57 in the control group ($P = 0.04$, Fisher's exact test).

“MACULAR PLUG”

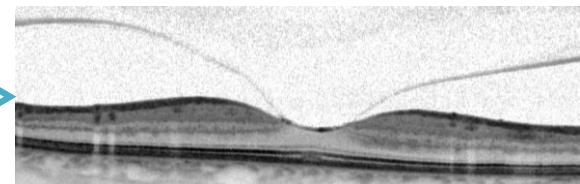

The autologous gluconated blood clumps (AGBC) solution was prepared immediately before starting the surgery by adding 1 mL of 5% glucose to 2 mL of autologous blood drawn from the patients' antecubital vein in the cubital fossa with strict attention to aseptic precautions during blood withdrawal.

 - Vitré attaché
 - < 400 µm : (ocriplasmine ou gaz?) chir.
 - > 400 µm : chirurgie ILM + position
 - > (650) 800 : ILM flap et autres

Conclusion

- Trou maculaire : une maladie rare mais un exemple de succès de la chirurgie vitrорétinienne
- Reste un model/laboratoire d'innovation
- Avec une armurerie de techniques pour personnaliser
 - La chirurgie des cas de bon pronostic est simplifiée
 - La chirurgie des cas de mauvais pronostic est consolidée
- Stade ultime une chirurgie simple et efficace rendant la personnalisation inutile....

FORMES CLINIQUES

SECONDARY MH

- TRAUMA

- ✓ Blunt Trauma
- ✓ Laser injury
- ✓ Retrobulbar needle perforation
- ✓ Electrical trauma
- ✓ Refractive surgery

- HIGH MYOPIA

- CATARACT

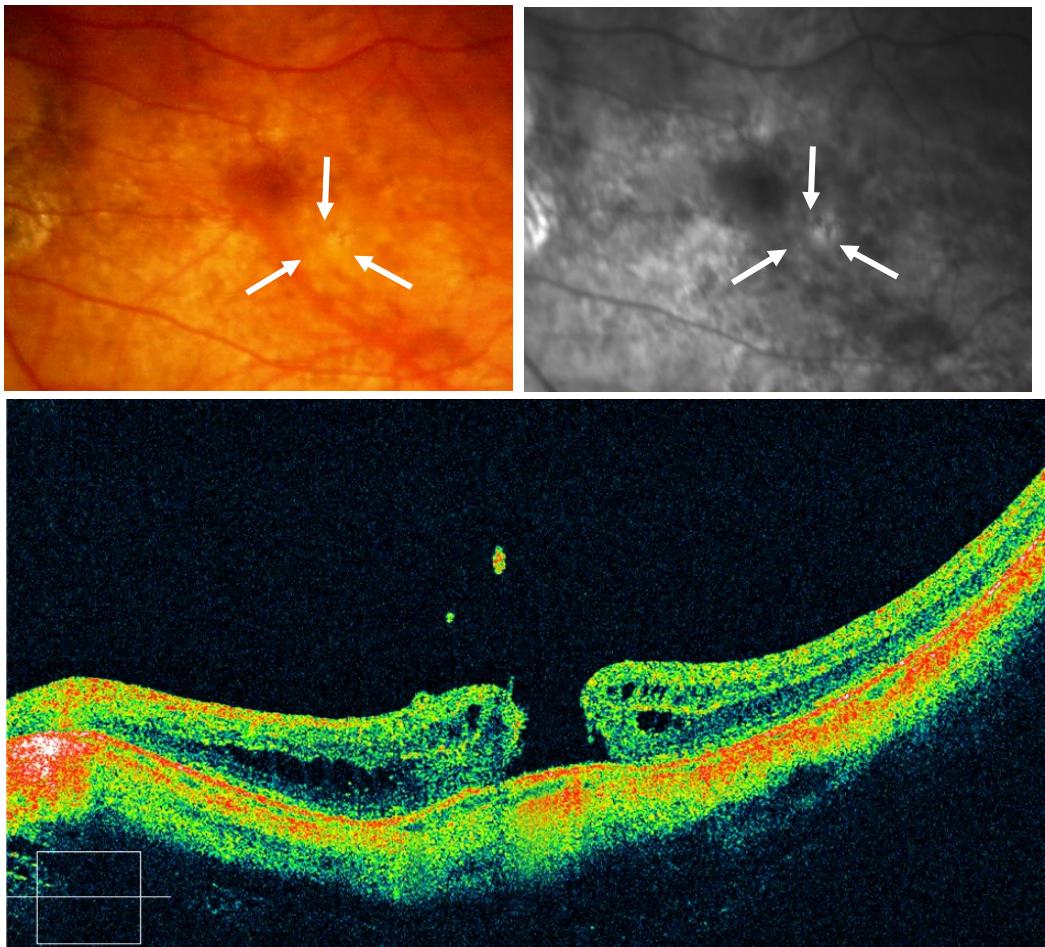

- ✓ cataract surgery
- ✓ Nd YAG capsulotomy

- MISCELLANEOUS

- ✓ Diabetic retinopathy
- ✓ Macular drusen
- ✓ Degenerative maculopathies
 - Adult vitelliform macular degeneration
 - Best's disease
 - Bull's eye maculopathy
 - Bietti's crystalline dystrophy
 - Alport's syndrome
- ✓ macular choroidal melanoma
- ✓ Submacular surgery

TM du myope fort

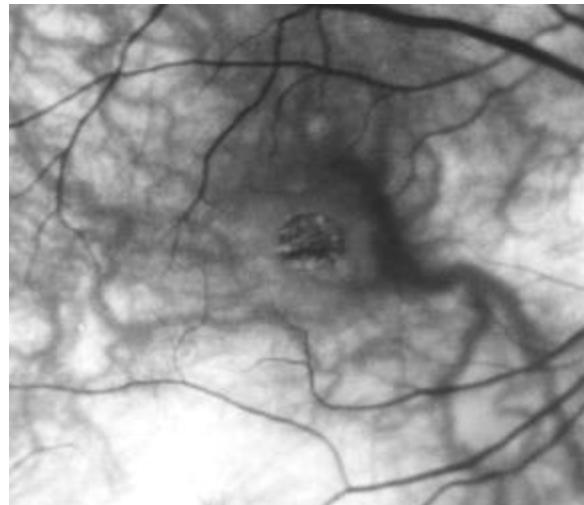

- Parfois asymptomatique et découvert seulement à l'OCT (6% des cas) ¹
- Fréquemment conséquence d'un foveoschisis ²

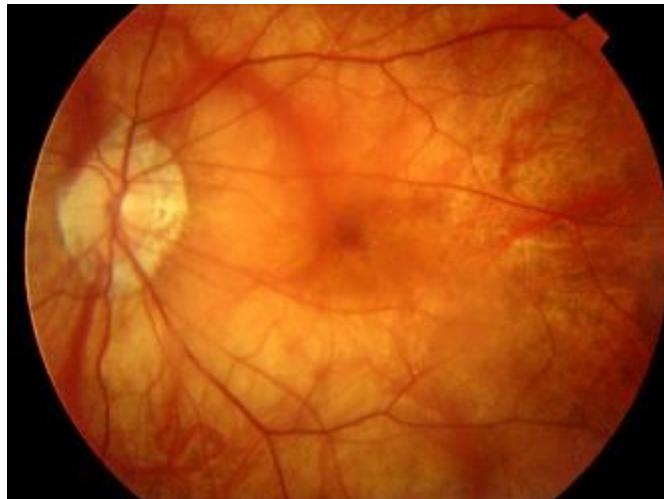

1. Coppe A et al. Prevalence of asymptomatic macular holes in highly myopic eyes. Ophthalmology 2005; 112(12):2103-9.
2. Shimada N., Br J Ophthalmol. 2008;92(6):762-4.

TM / myopie forte

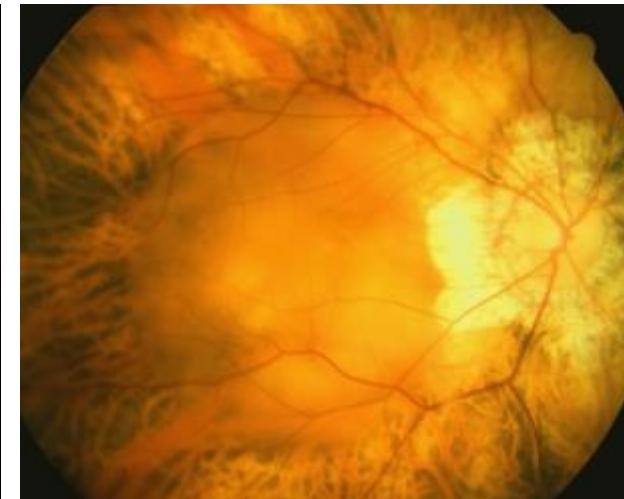

- L'apparition d'un TM est une complication fréquente de la myopie forte
- 3 formes cliniques

TM à plat

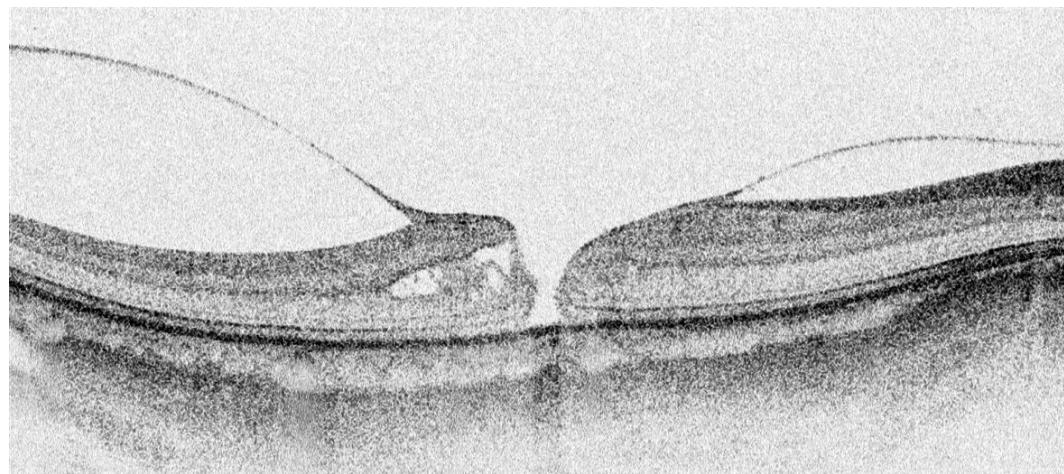

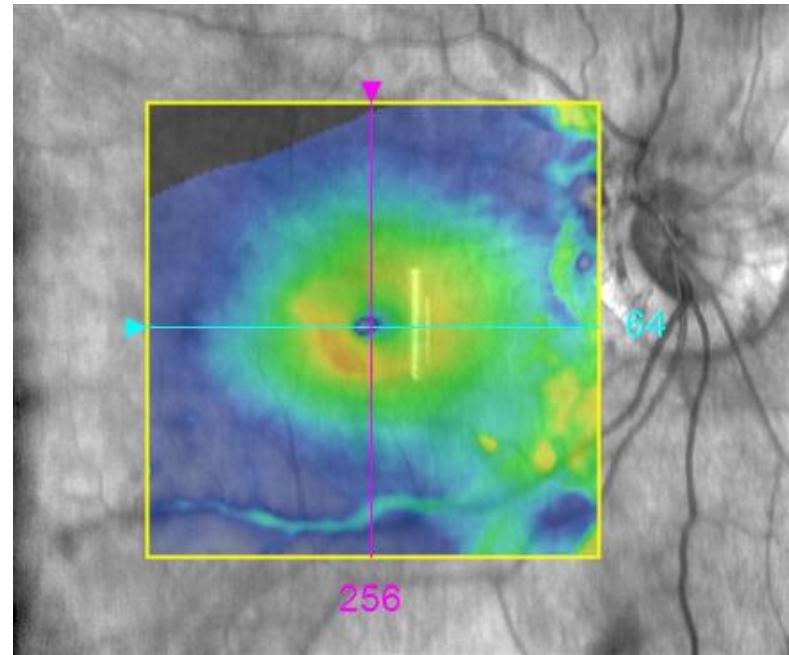

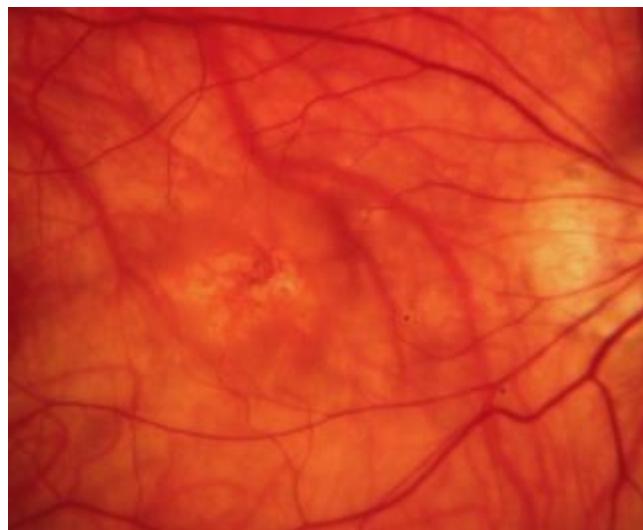

TM/Fovéoschisis

DR/TM

TM à plat du myope fort

- Parfois baisse visuelle
 - surtout sensible de près
 - Typiquement modérée
- diagnostic FO malaisé :
 - peu de contraste
 - Bon examen / verre de contact
- OCT

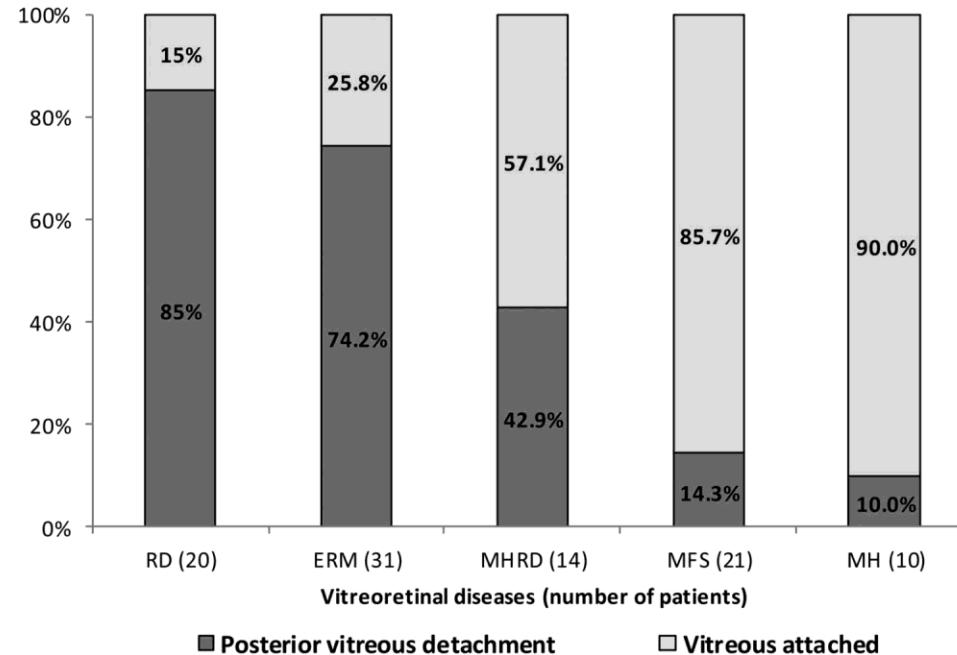

POSTERIOR VITREOUS DETACHMENT IN HIGHLY MYOPIC EYES UNDERGOING VITRECTOMY

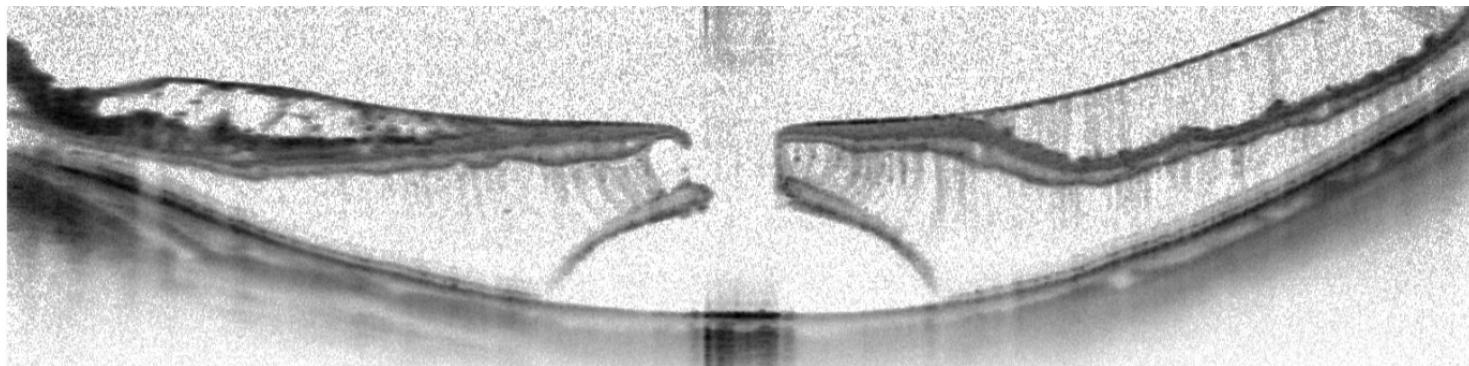

ELISE PHILIPPakis, MD,* AUDE COUTURIER, MD,* DAVID GAUCHER, MD, PhD,†

RAMIN TADAYONI, MD, PhD*

1074 RETINA, THE JOURNAL OF RETINAL AND VITREOUS DISEASES • 2016 • VOLUME 36 • NUMBER 6

Fig. 2. Complete posterior vitreous detachment rates in highly myopic eyes, which underwent vitrectomy, by vitreoretinal disease. ERM, epiretinal membrane; MFS, myopic foveoschisis; MH, myopic macular hole; MHRD, macular hole retinal detachment; RD, rhegmatogenous retinal detachment.

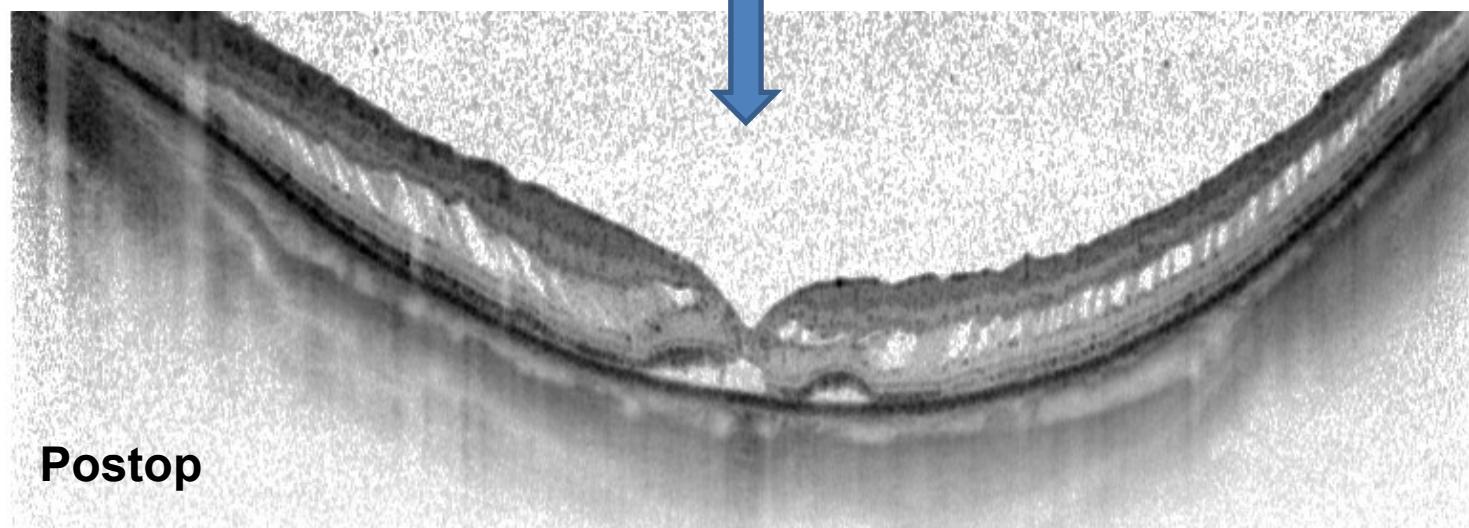

Jonction vitréenne anormale

Preop

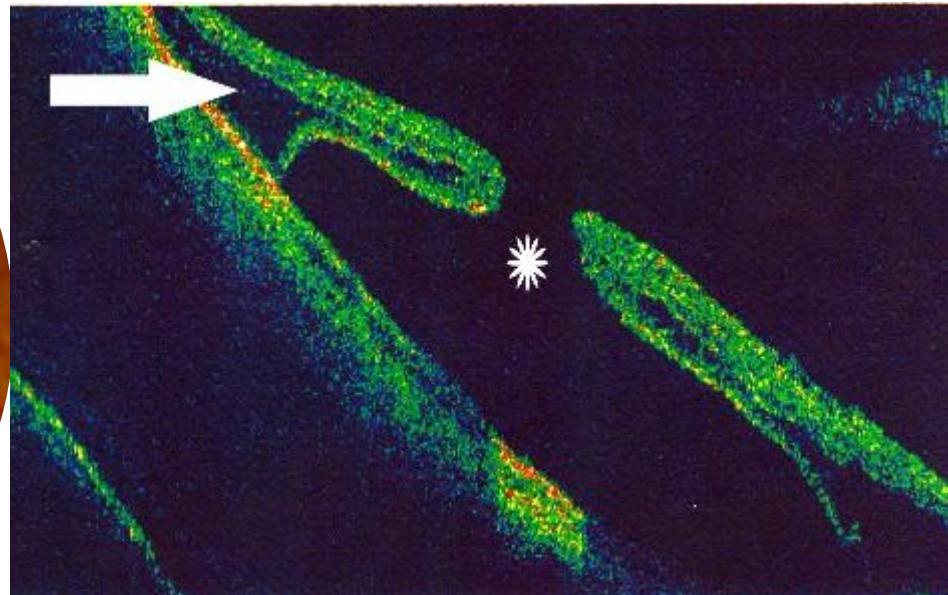

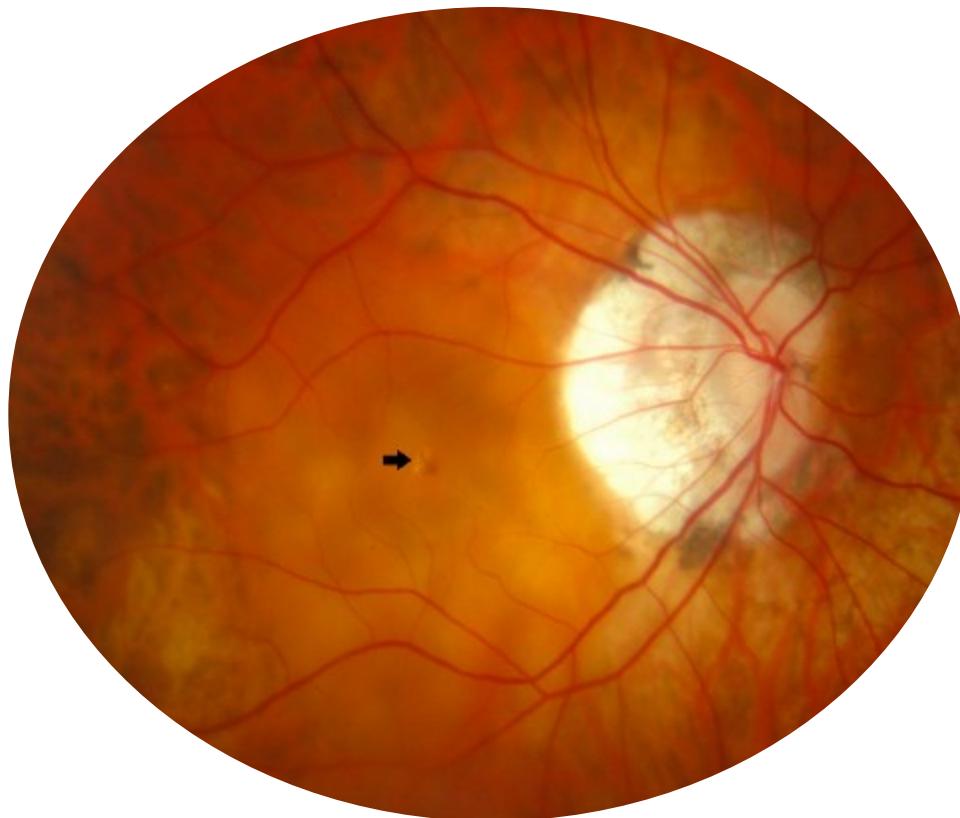

200 μ m

Postop

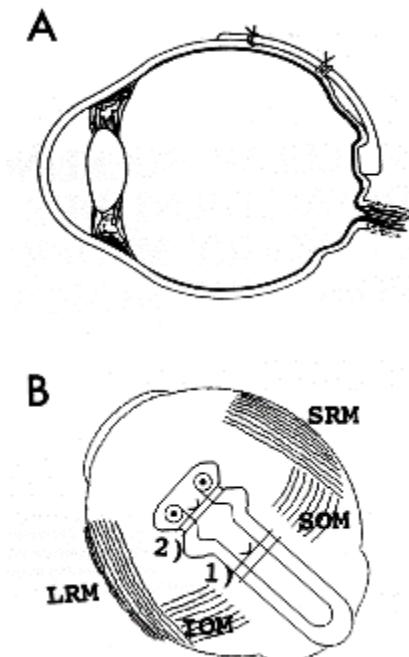

DR / TM

- DR du pôle postérieur TM
- N'existe que chez le myope fort (staphylome postérieur)
- Rare parmi les DR
 - 0,5 à 1% de tous les DR
 - mais jusqu'à 10% en Asie

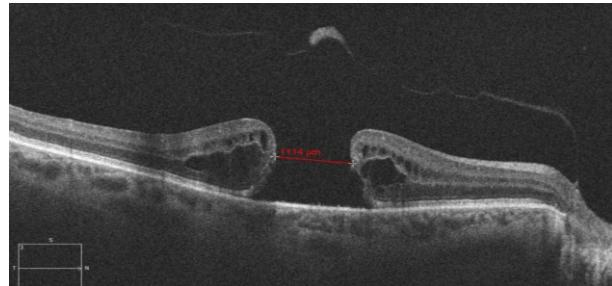

Chirurgie DR / TM / myopie forte

- Est une indication opératoire
- Vitrectomie dissection gaz sans laser
 - En utilisant des « agents de visualisation »
 - Double pelage (triamcinolone + TB) : succès 70%
 - *Li KK et al. Clin Experiment Ophthalmol. 2010*
- Si échec/récidive :
 - Laser maculaire
 - 96,2 % de succès avec pelage MLI et laser
 - *Yu J et al. OSLI 2010*
 - Au besoin avec silicone à long terme
- Parfois indentation maculaire +/- gaz
 - *SASOH, MITAMURA 2000*
RIPANDELLI STIRPE 2001,
THEODOSSIADIS 2005

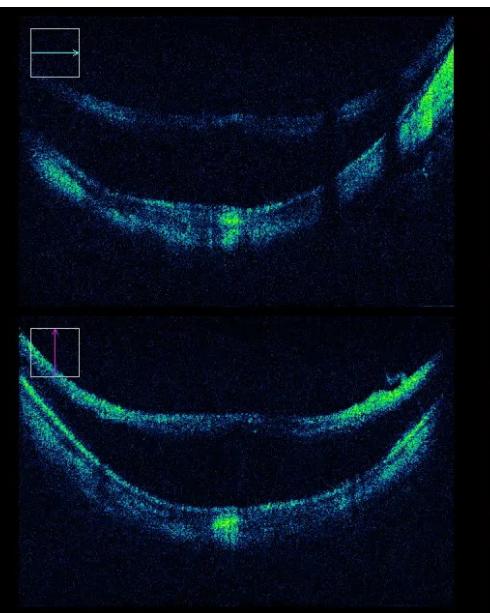

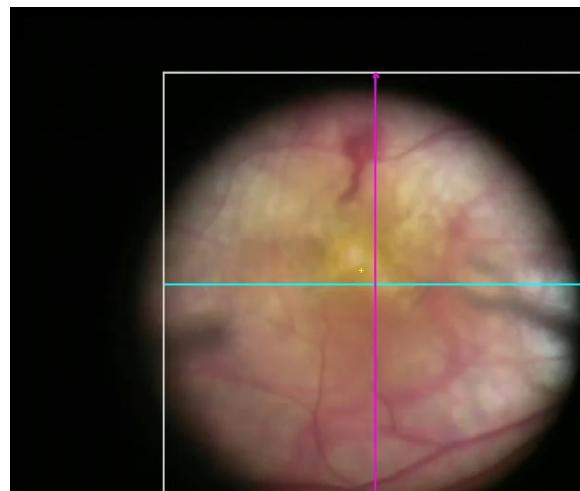

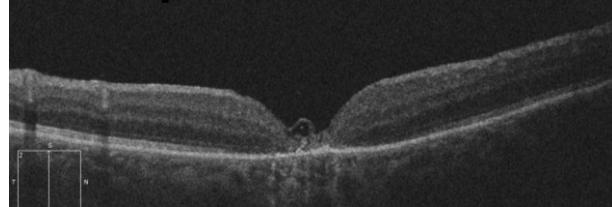

ILM flap

- **Synonyme : Lambeaux de MLI (transposition ou libre)**

NORIAKI SHIMADA, YOSHIHARU SUGAMOTO, MANABU OGAWA, HIROSHI TAKASE, AND KYOKO OHNO-MATSUI

Fovea-sparing surgery

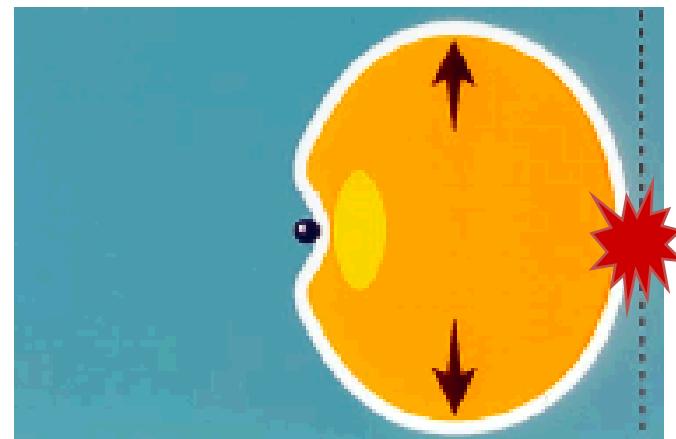

Conclusion : TM/Myopie forte

- La myopie forte est assez fréquemment compliquée d'un TM
- Il faut opérer les TM/ myopie forte si le TM est responsable
 - Baisse d'acuité visuelle
 - Décollement de rétine
- Principal facteur pronostic pour l'œil opéré : La longueur axiale
 - ROBERT F. LAM et al. AJO 2006
 - NAKANISHI H. et al. AJO 2008
- Probabilité de DR/TM de l'œil adelphé : $\approx 8\%$ à 5-7 ans

Traumatic MH

- usually in young males: *industrial accidents, ball games...*
- no Posterior Vitreous Detachment
- mechanism: deformation of the eyeball
 - flattening of the posterior pole
 - stretching of the macula
 - opening of the fovea

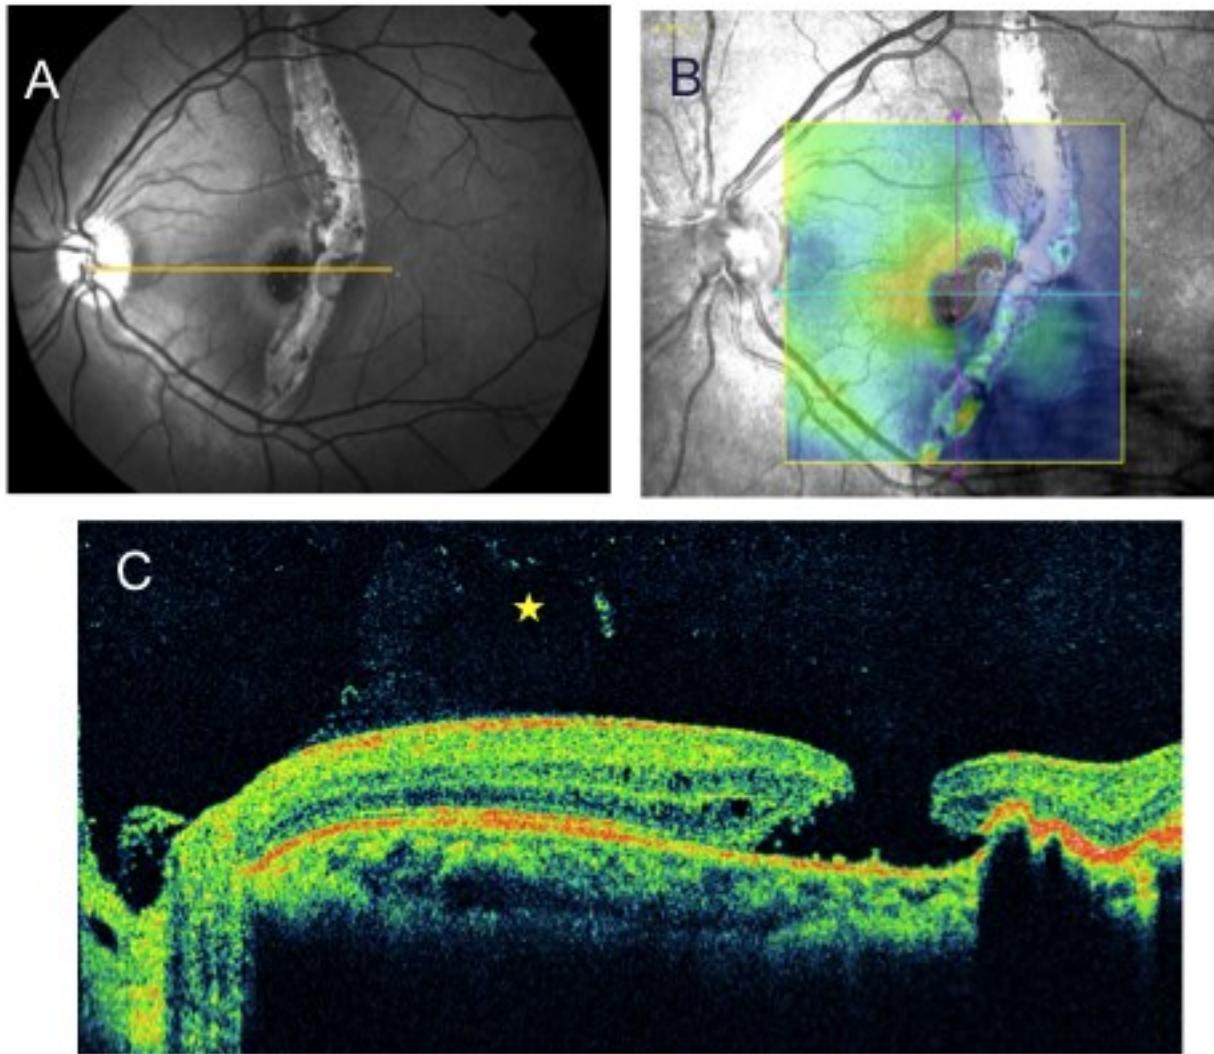

Traumatic MH

- The prognosis depends on the associated lesions
 - RPE atrophy
 - Choroidal rupture

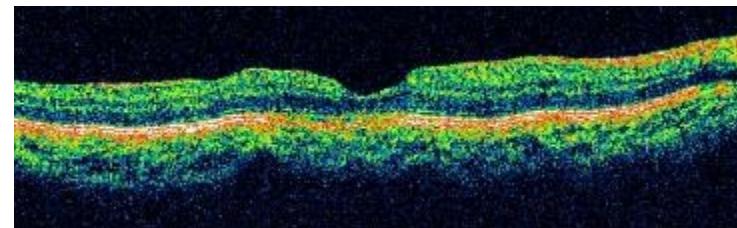

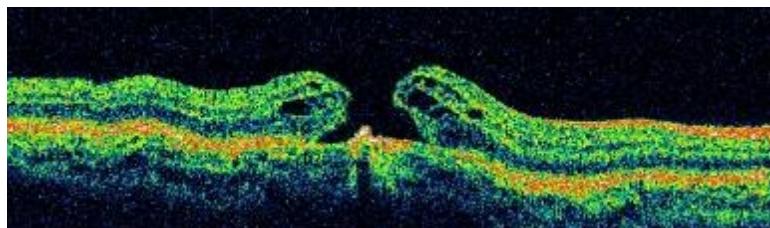

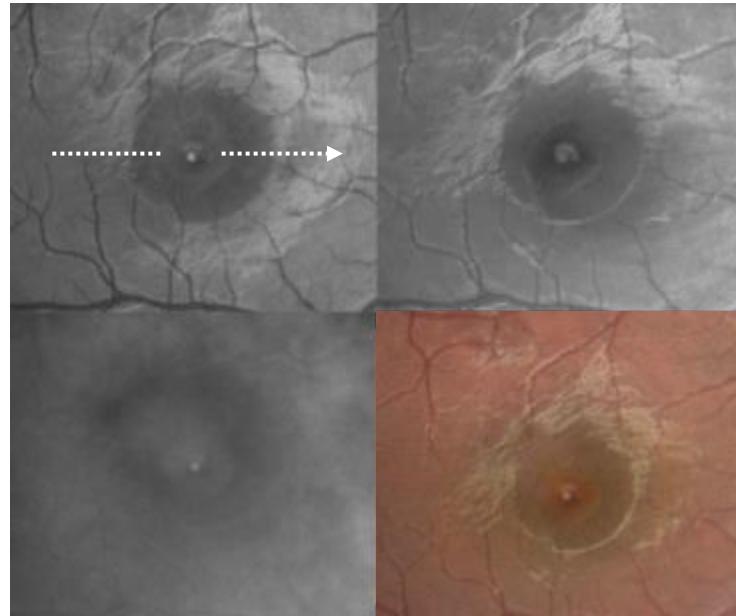

Traumatic MH

Trou maculaire post contusif

- pré et post opératoire

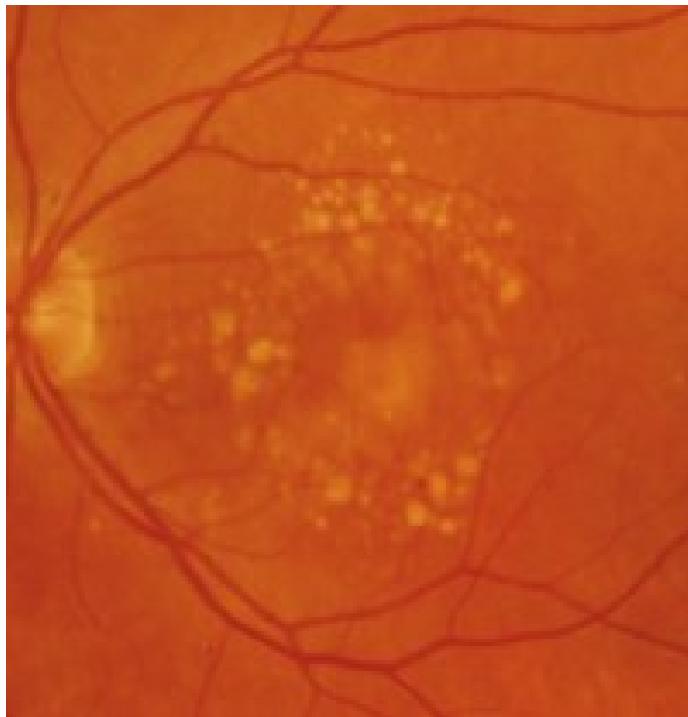

MACULAR HOLE BY LASER INJURY

- Accidents during adjustment and alignment of the laser beam of industrial or research lasers (Nd:YAG)
- May close spontaneously
- Successful surgery reported in 2 cases

MACULAR HOLE and DRUSEN

- Macular drusens are not rare in the range of age for MH
- Berinstein, *Ophthalmology 2000*:
 - 32 eyes, 76 % success - good visual recovery

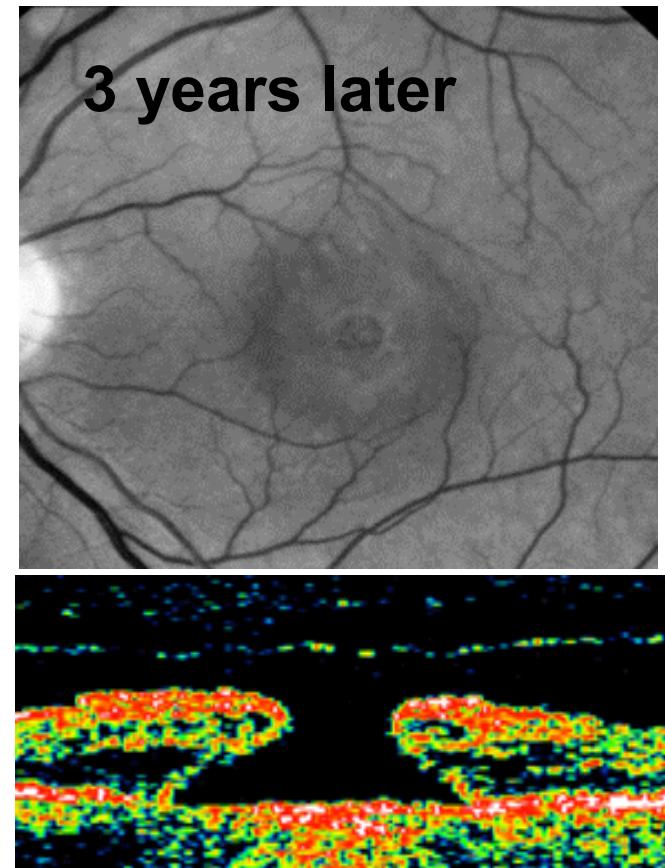

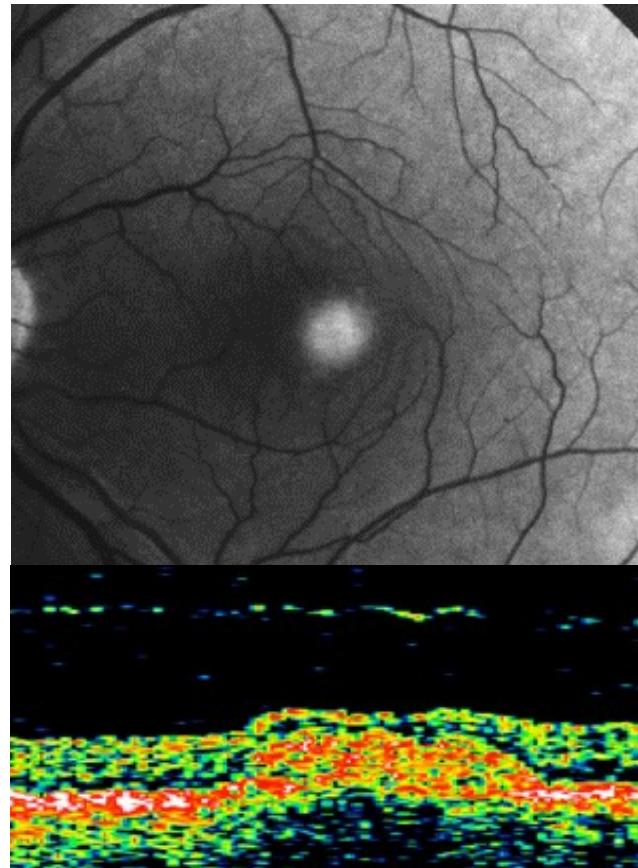

RIBO

2 years later

MACULAR HOLE & HEREDITARY MACULOPATHIES

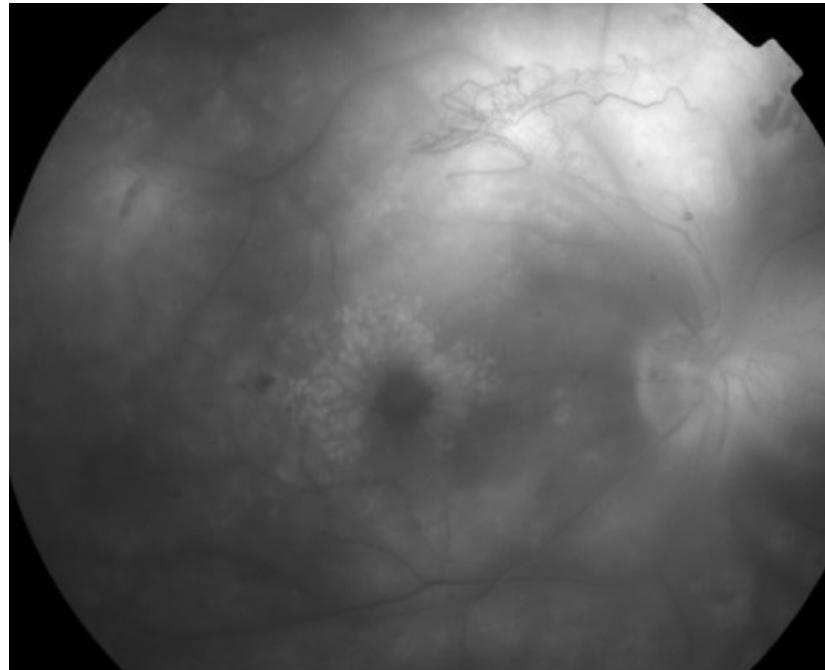

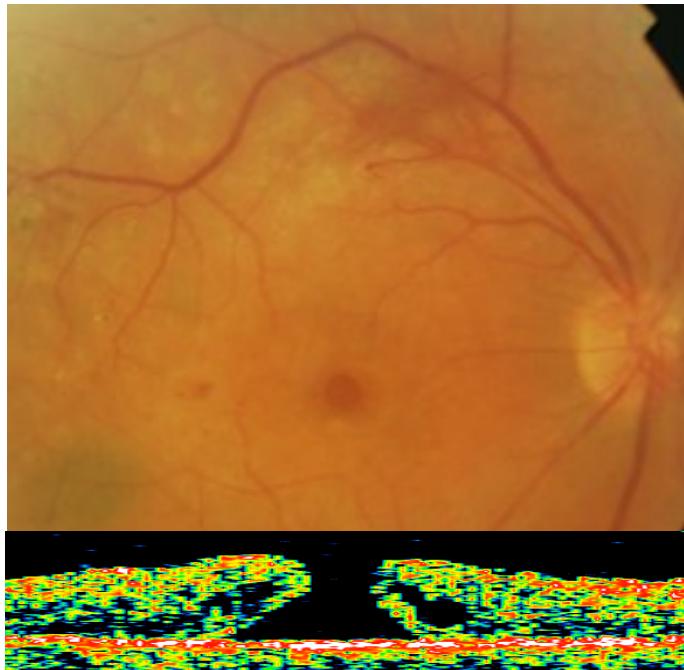

- MH may occur in Best's disease, adult onset vitelliform degeneration, Bietti's crystalline dystrophy , etc..

- In adult onset vitelliform degeneration, OCT shows foveal thinning over the subretinal deposit

MH in diabetic retinopathy

- MH is a rare complication of DR
 - It may be the consequence of tractional cystoid macular edema
