# 26<sup>e</sup> Anniversaire de l' OCT

Vitesse de scan (*A-scans per second*): 100 A-scans/sn → 200,000 A-scans/sn

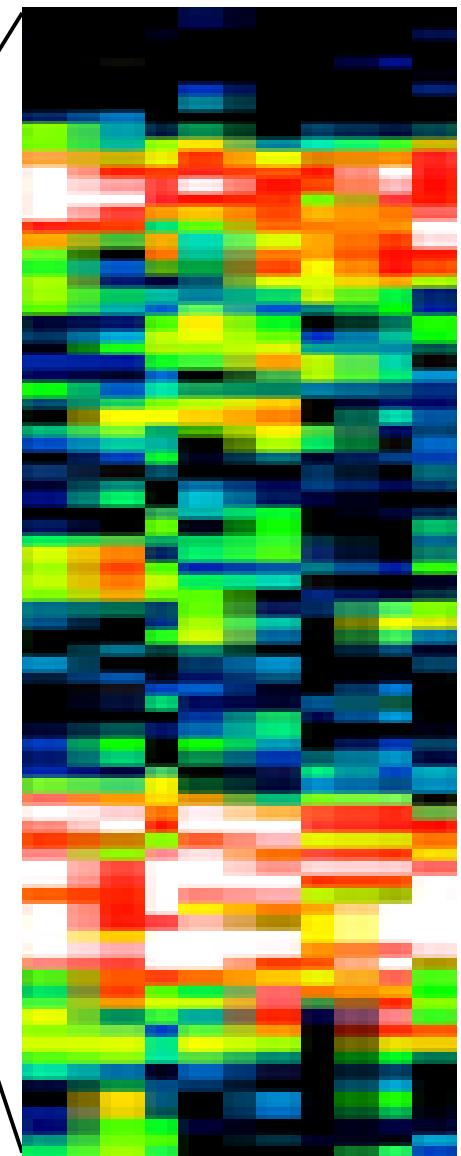

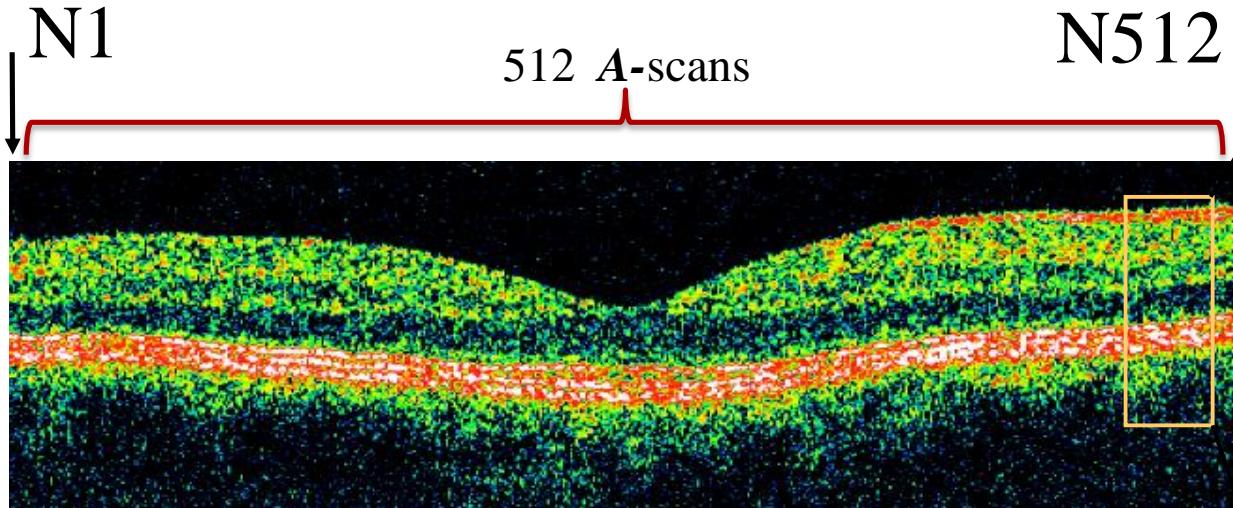

Résolution axial: 12 μm → 4-5μm

Résolution longitudinal (*A scan / B scan*): 128 → 4096

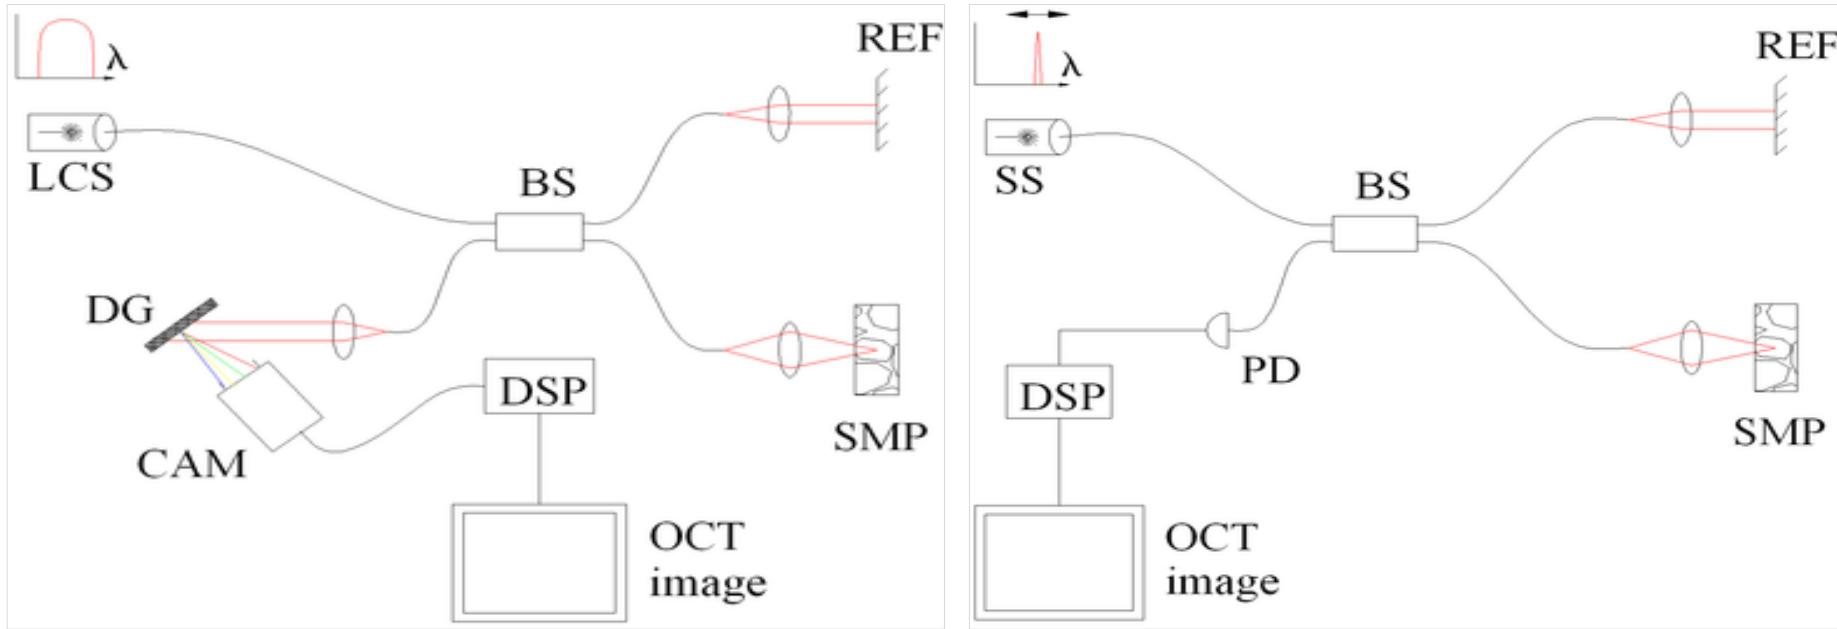

Enregistrement du signal de réflexion sous forme de pics d'amplitude variable comparable à un « écho A » (on utilise la lumière et non les Ultrasons) → **A-Scan**

# OCT 3

- L'image en OCT3 est composée de 512 (résolutions à 128 & 256 possibles) A-scans successifs en 1,28 sec
- Résolution longitudinale d'environ  $8-10\mu\text{m}$

# Swept Source OCT (SS-OCT)

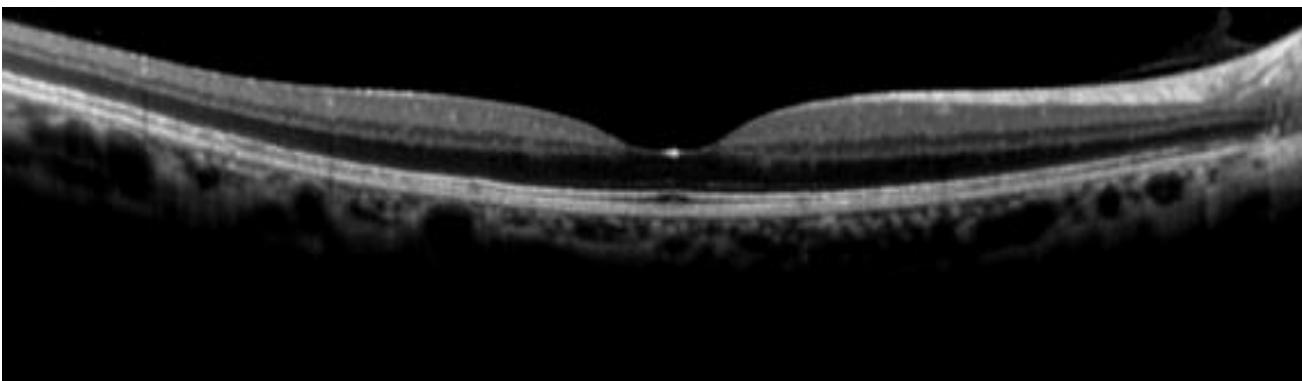

Spectral discrimination by fourier-domain OCT.  
Components include: low coherence source (LCS), beamsplitter (BS), reference mirror (REF), sample (SMP), diffraction grating (DG) and full-field detector (CAM) acting as a spectrometer, and digital signal processing (DSP)

Spectral discrimination by swept-source OCT.  
Components include: swept source or tunable laser (SS), beamsplitter (BS), reference mirror (REF), sample (SMP), photodetector (PD), digital signal processing (DSP)

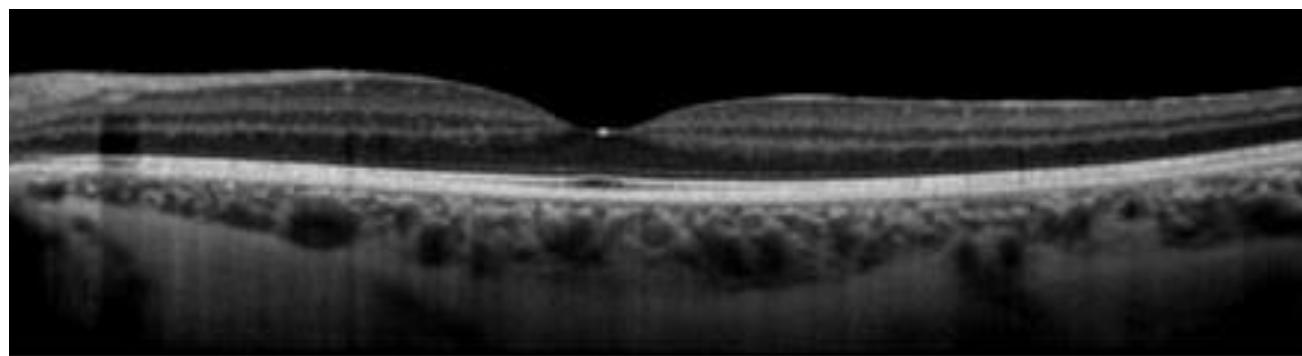

# SD-OCT & SS-OCT

- Vitesse d'acquisition
  - 80 000 à 100 000 A-scans/sec
  - 100 000 à 200 000 pour le SS-OCT
- Résolution axiale
  - 5-7 µm
  - 6,3 µm le SS-OCT (Cirrus)
- Meilleure résolution longitudinale (A scan / B scan)
  - 128 lignes x 512 pts (Cirrus)
  - 400 lignes x 400 pts (Optovue)

# Critères pour obtenir une bonne qualité des examens (1)

Avant de capturer une image, suivez ces directives afin d'optimiser la qualité des images.

## 1. L'image de l'iris :

- Centrez l'image de l'iris à l'intérieur de la pupille (celle-ci peut être légèrement déplacée en fonction de l'inclinaison de la rétine ou afin d'éviter l'opacité).
- Centrée sur le détail de l'iris.

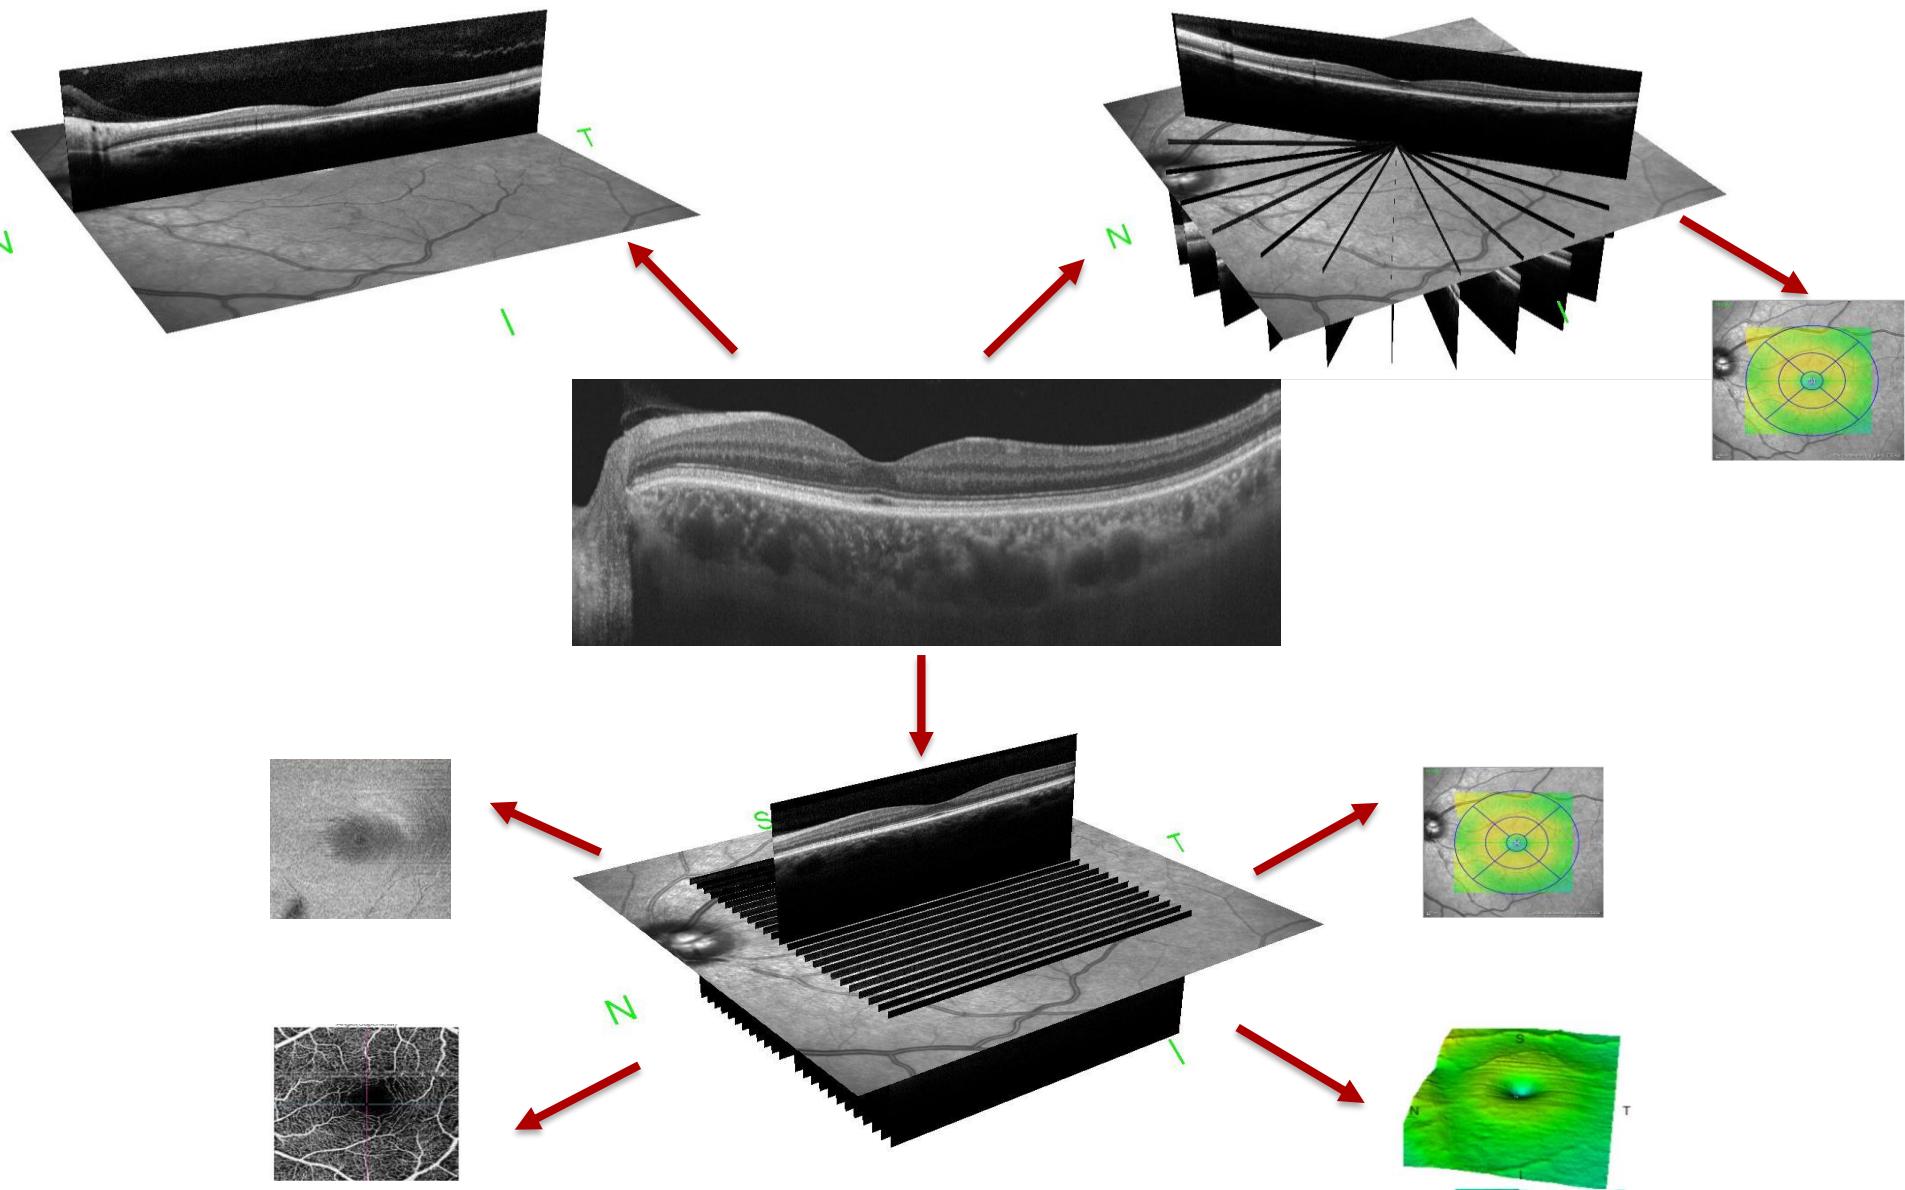

## 2. L'image du fond d'oeil :

- La focalisation doit être forte et claire, de préférence avec une bonne visibilité de la ramification des vaisseaux sanguins.
- Centrez le calque d'examen sur la fovéa pour les examens maculaires et sur la tête du nerf optique pour les examens de disque optique.
- Assurez un éclairage uniforme sans les coins sombres.
- Il n'y devrait pas avoir d'artéfacts ou, le cas échéant, il y devrait en avoir peu, car ceux-ci peuvent jeter des ombres sur les examens OCT.
- L'image en-face OCT doit avoir un minimum de saccades et pas de saccades à travers la zone d'intérêt (macula, par exemple).
- Les corps flottants peuvent être souvent déplacés en demandant au patient de changer les yeux avant de la capture d'image.
- Les opacités cornéennes peuvent être minimisées par le réalignement de la Pupille

## Critères pour obtenir une bonne qualité des examens (2)

### 3. L'examen OCT :

- Centrez l'examen OCT dans la partie moyenne vers supérieure de l'écran d'acquisition d'examen.
- L'examen OCT de type B doit être complet dans toutes les fenêtres, sans données manquantes.
- La densité des couleurs devrait être le même de bout en bout.
- La force du signal devrait être 6 ou supérieure.
- Une rétine inclinée peut être corrigée par le déplacement de la pupille hors du centre de l'alignement pour permettre un niveau plus grand de l'examen OCT.
- Ajustez le réglage d'amélioration pour obtenir le plus brillant et le plus clair examen.

# CIRRUS HD-OCT (Zeiss)

**Image FO:** SLO

**Source optique :** superluminescent diode (SLD), 840 nm

**Puissance optique:** < 725 µW à lacornée

**Vitesse d'examen:** **100,000 A-scans per second**

# Protocole d'acquisition pour Line Raster

- **5 Line-Raster**
  - **5 Line-Raster**
    - Rotation : 0°- 360°
    - Longeur: 3.0 - 6.0 – 9.0 mm, 4096 A-scans
    - Espacement (mm) : 0.025, 0.05, 0.075, 0.125, 0.2, **0.25**, 0.5,1.25
  - **HD 5 Line-Raster (5x1024 A-scans)**
  - **HD 1 Line-Raster 20x** (20x1024 A-scans)

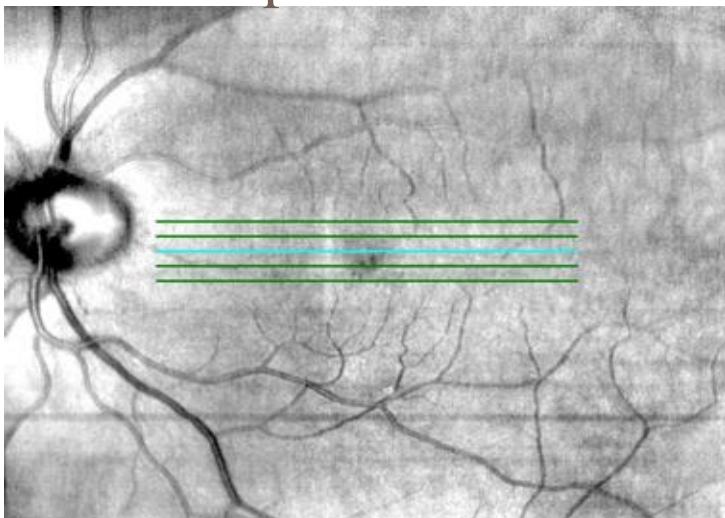

# L'espacement des lignes

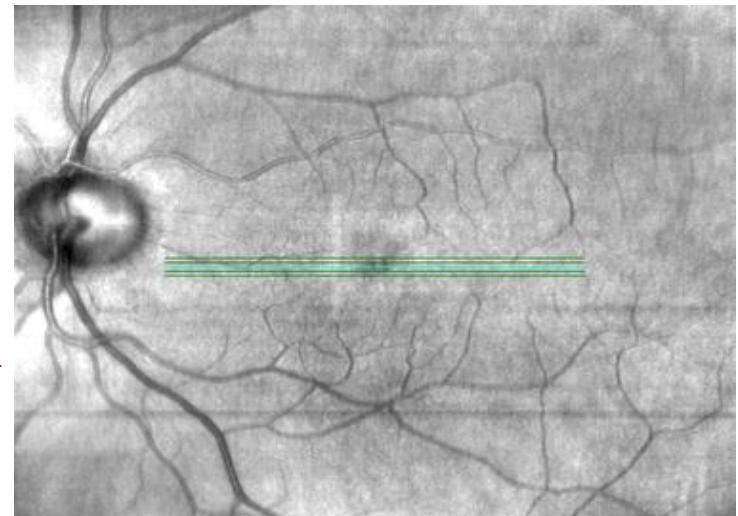

0.25 mm  0.075 mm

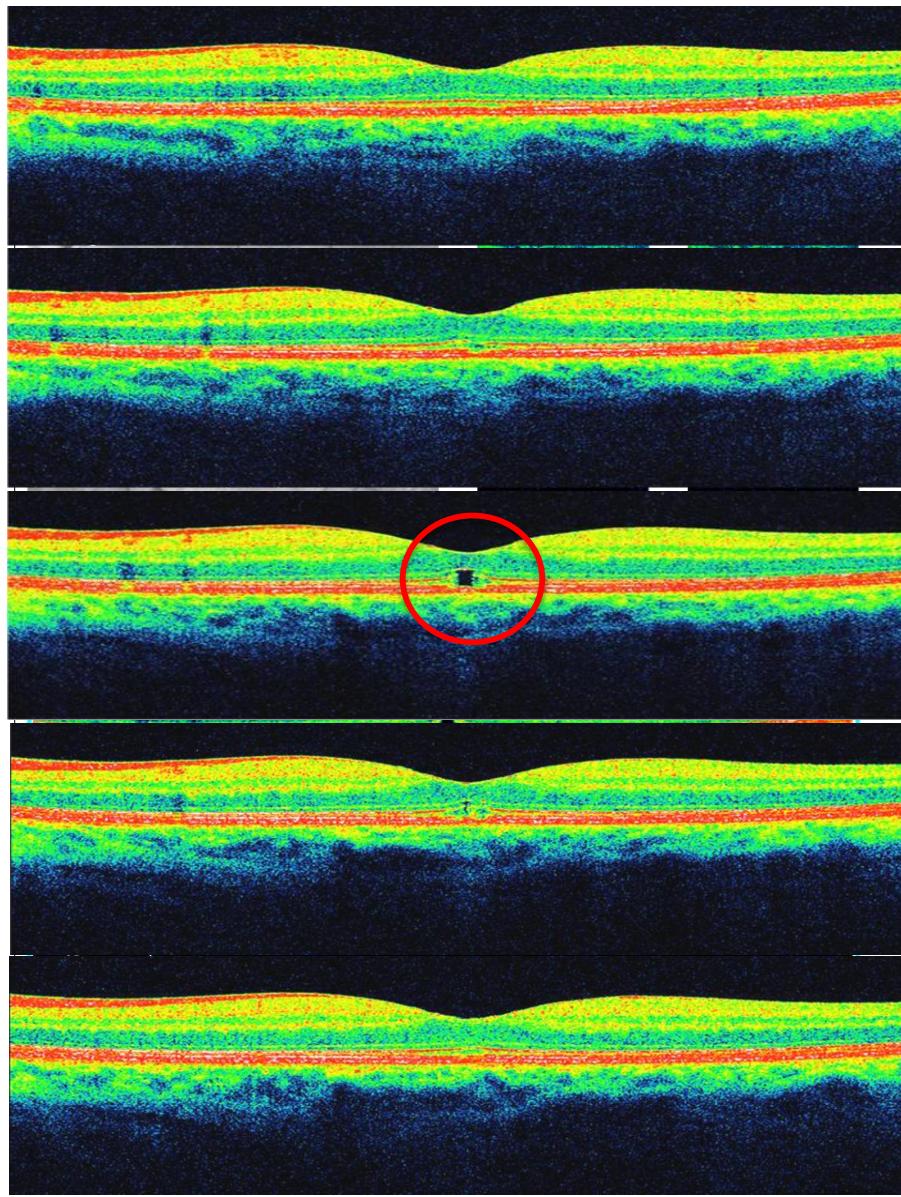

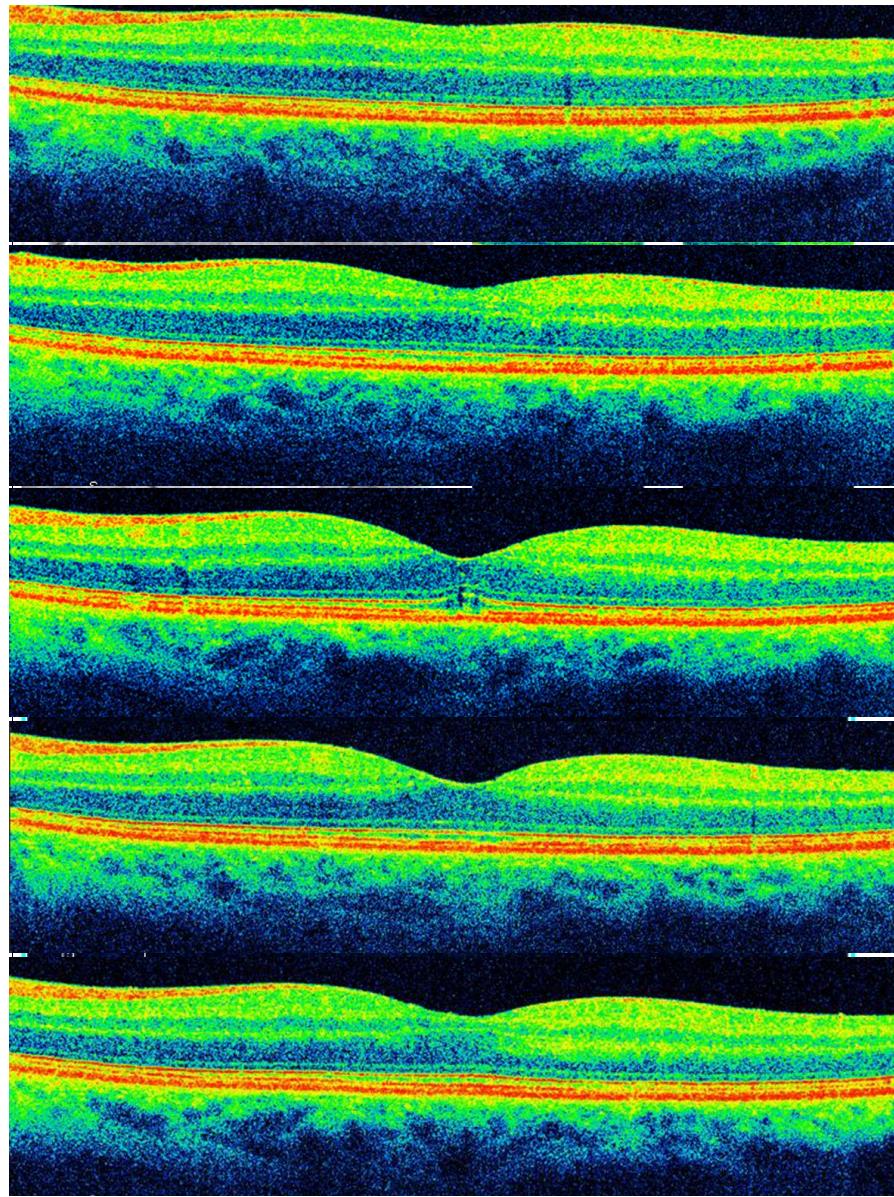

Valeur par défaut

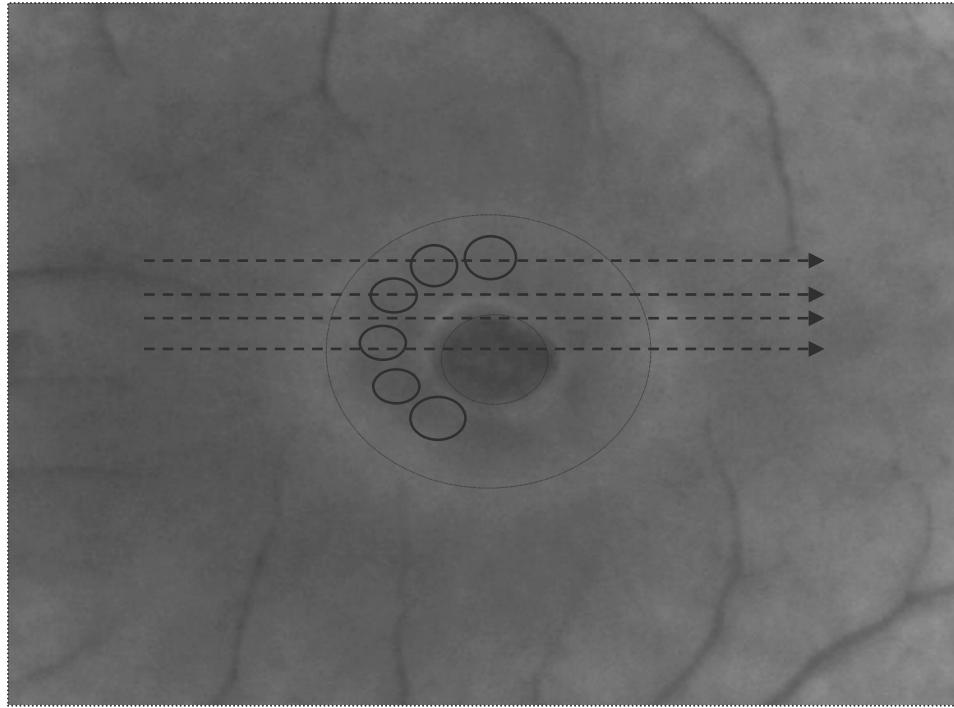

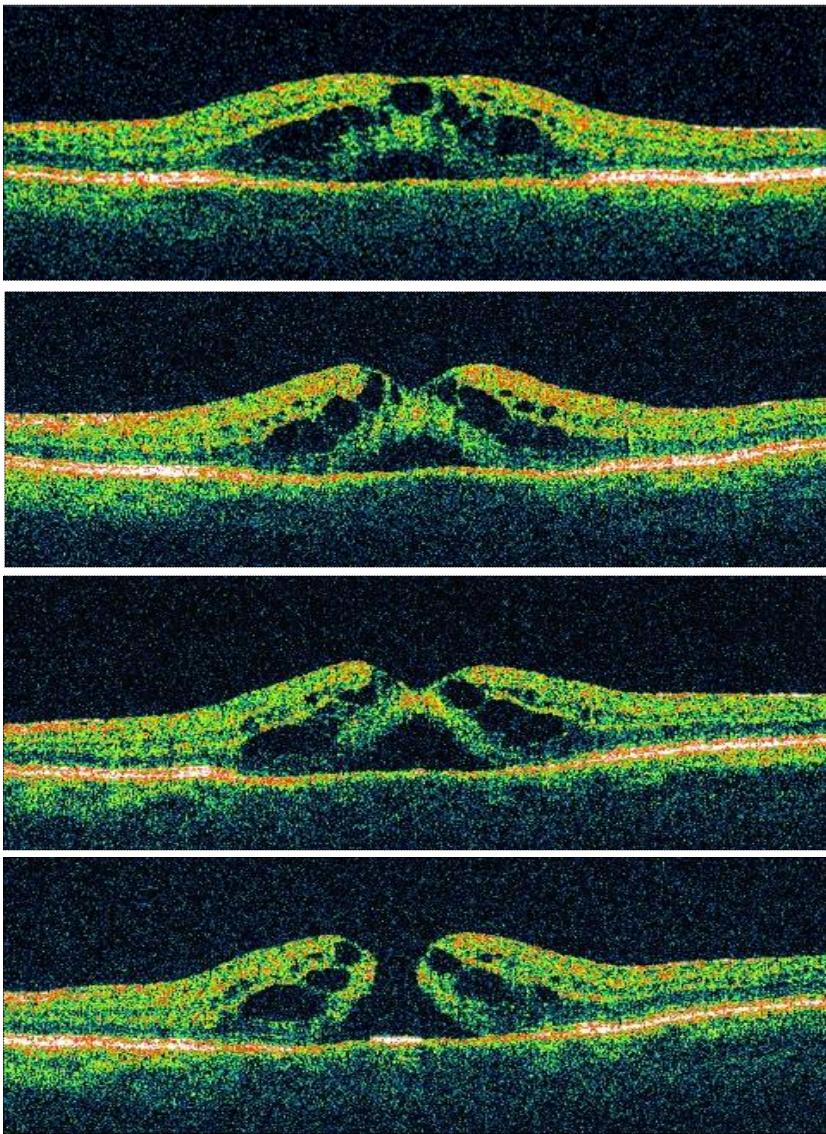

4 x 0.25 : 1 mm (*1000μ*)

4 x 0.075 : 0.3 mm (*300μ*)

# Modes d'acquisition (SPECTRALIS-HEIDELBERG)

Possibilité d'extension avec l'angio confocal-SLO HRA2 afin de confronter différents types d'imagerie (6 modes) :

- Vitesse d'examen: 85,000 A-scans per second
- OCT
- angiographie à la fluorescéine
- angiographie au vert d'Ifracyanine
- autofluorescence
- Red Free
- Infrarouge
- Multicolor
- OCT-A

## Fonctionnalités particulières :

- L'ophtalmoscope à balayage laser confocal (**cSLO**)
- Technologie de réduction du bruit (Heidelberg Noise Reduction Technology™)
- Système de moyennage automatique en temps réel des images (ART ou Automatic Real Time, 1 à 100)
- Eye tracking** (TruTrack™ Technology) : suivi des mouvements oculaires, maintien de la position du scan sur la rétine durant l'examen
- Autorescan (Repositionnement automatique du scan sur l'emplacement de l'examen initial).
- C'est le seul système permettant de placer un scan OCT sur une image d'angiographie acquise simultanément.

**Eye tracking** + Repositionnement automatique du scan sur l'emplacement de l'examen initial

**Bonne reproductibilité**

# Mode haute résolution (*High Resolution Mode*)

Résolution numérique ( $\mu\text{m}$ ) : 3.8 axial x 6 latéral

Résolution optique ( $\mu\text{m}$ ) : 7 axial x 14 latéral

Diamètre pupillaire minimum : 2.5 mm

Vitesse de balayage : 80 000 A scan / sec

Cibles de fixation : interne et externe

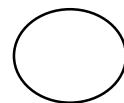

## Modèle de scan linéaire :

- Taille de l'image (pixels) : (1536 x 496) / (1024 x 496) / (768 x 496)
- Temps d'acquisition mini (ms) : 39 / 26 / 19

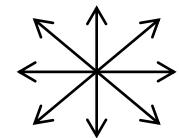

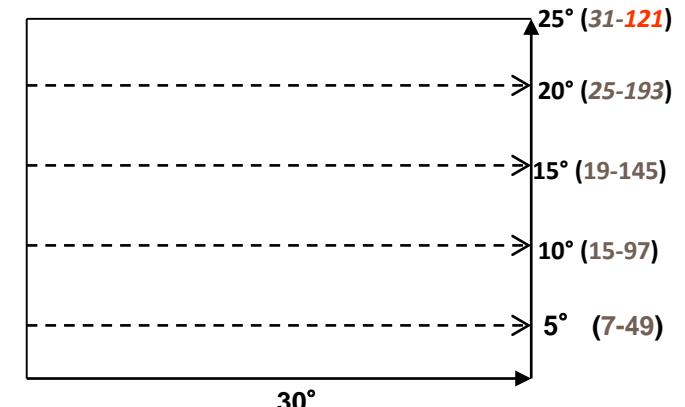

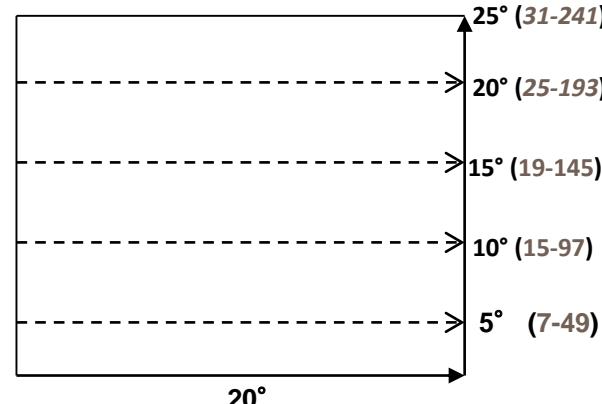

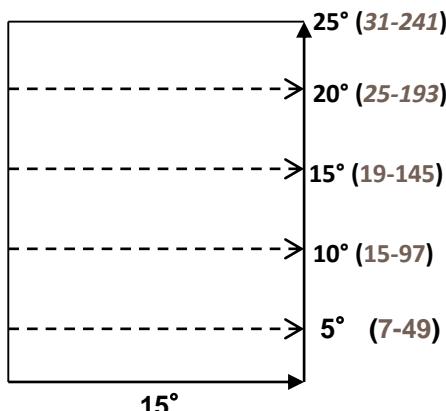

## Modèle de scan circulaire :

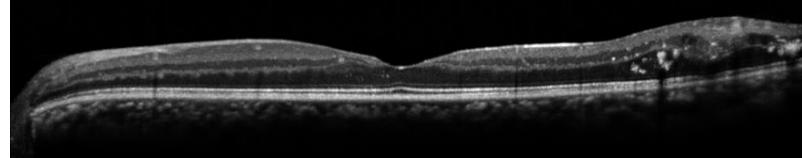

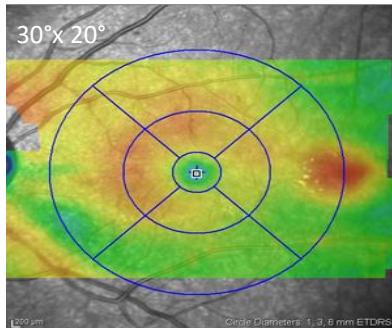

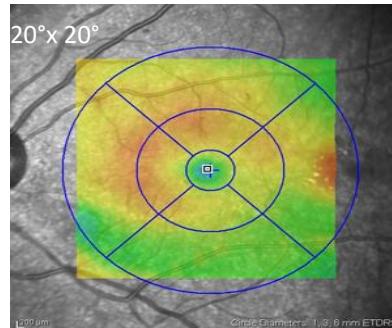

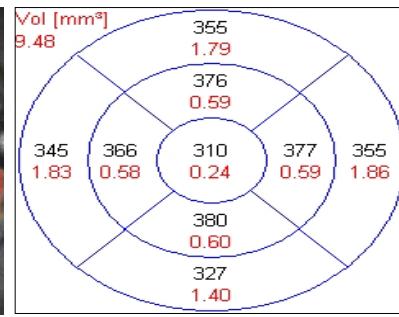

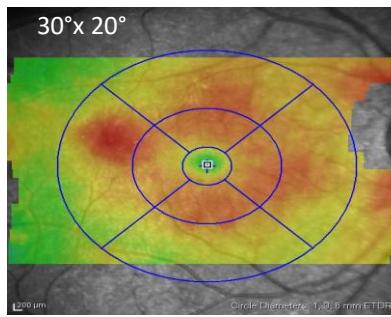

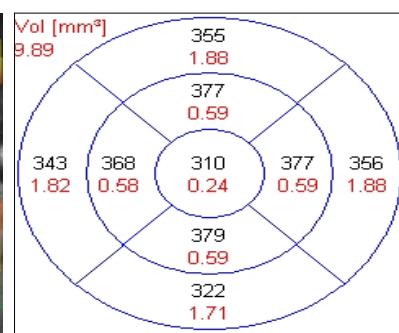

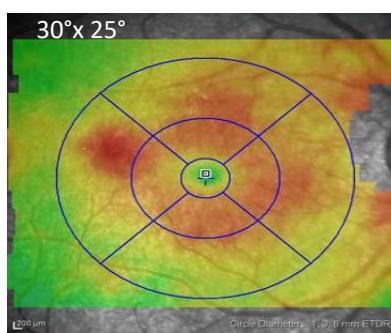

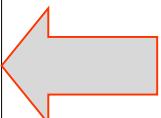

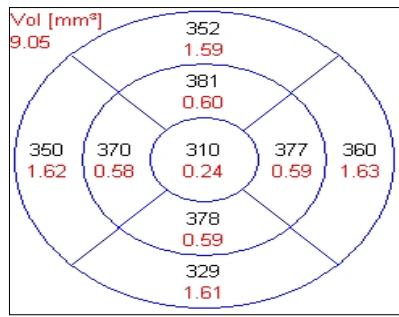

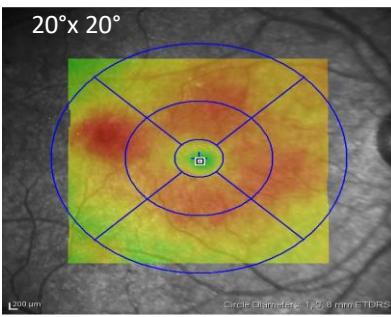

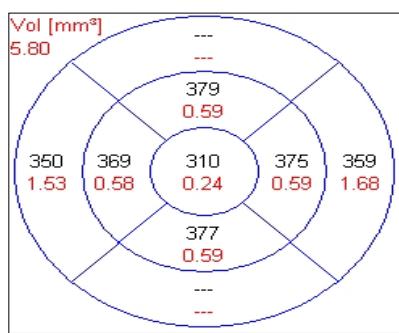

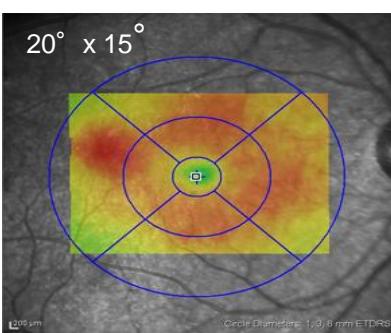

- Taille de l'image (pixels) : (1535 x 496)
- Temps d'acquisition mini (ms) : 52

## Modèle de scan en volume :

- Etendu horizontal ( $^{\circ}$ ) : 30 / 20 / 15
- Etendu vertical ( $^{\circ}$ ) : 25 / 20 / 15 / 10 / 5
- Nombre de coupes par scan de volume : 7 à 241 ( $\updownarrow$  240 $\mu\text{m}$  à 30 $\mu\text{m}$ )

# Volume Scan à 49 lignes

Save Images Setup Exit

The image shows a screenshot of an OCT (Optical Coherence Tomography) software interface. The main window displays an 'IR Reflection Image' on the left, featuring a circular pattern of colored dots (red, green, blue) centered on a vertical blue line. To the right of the image are several control panels:

- Application Preset:** Set to "Retina". Other options include Fast, Dense, Detail, P.Pole, and 7Lines. Buttons for Custom are also present.
- OCT Control:** Includes icons for Follow-Up, OCT M, and EDI.
- Scan Options:** Displays a grid of icons representing different scan patterns (e.g., cross, circle, asterisk, grid). A red dashed circle highlights the first icon. Below this are controls for "ART 100 frames", "30°" (angle), "2 sections", and "90.0°" (angle).
- Scanning Parameters:** Shows "1536 A-scans".
- Image Quality:** A slider labeled "Quality: 0".
- Settings and Timers:** Includes fields for Eye (OD, OS), Angle (30°), Focus (1.50 D), Sens. (59), Power (IR 100%), Mode (OCT Star), Rate (4.7/sec), Res. (High Res.), ICGA, FA, and Memory (Images: 0, Free: 999 MB).
- Bottom Navigation:** Buttons for ART / Live, HR, OCT, and a power button.

At the bottom of the screen, a green banner reads: "Use touch panel to operate the camera..."

**HRA+OCT SPECTRALIS™** HEIDELBERG ENGINEERING

# Protocole d'acquisition

## toujours les deux yeux

L'examen standard OCT pour une première fois doit comporter

- cube 6x6
- 2 raster lignes 9 mm H + V séparées de 75  $\mu$  sur le *Cirrus* , ou 2 lignes simples 9x9 H+V sur *Spectralis* toujours EDI

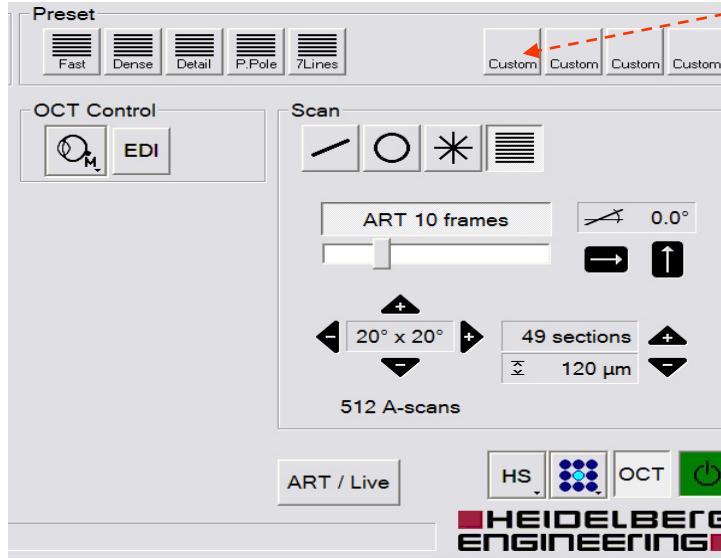

ou : radial lignes

- 1 ligne 12 mm papille macula
- RNFL + CG

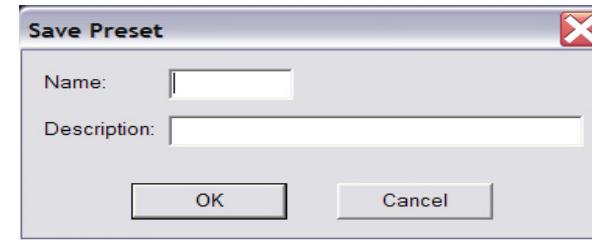

Coupes additionnelles selon pathologie

- Exploitation post acquisition ( segmentation ILM , CC etc..) selon pathologie
- Suivi : toujours recommencer les coupes précédentes + coupes additionnelles si nécessaire

# On peut créer les icône préréglés en « CUSTOM »

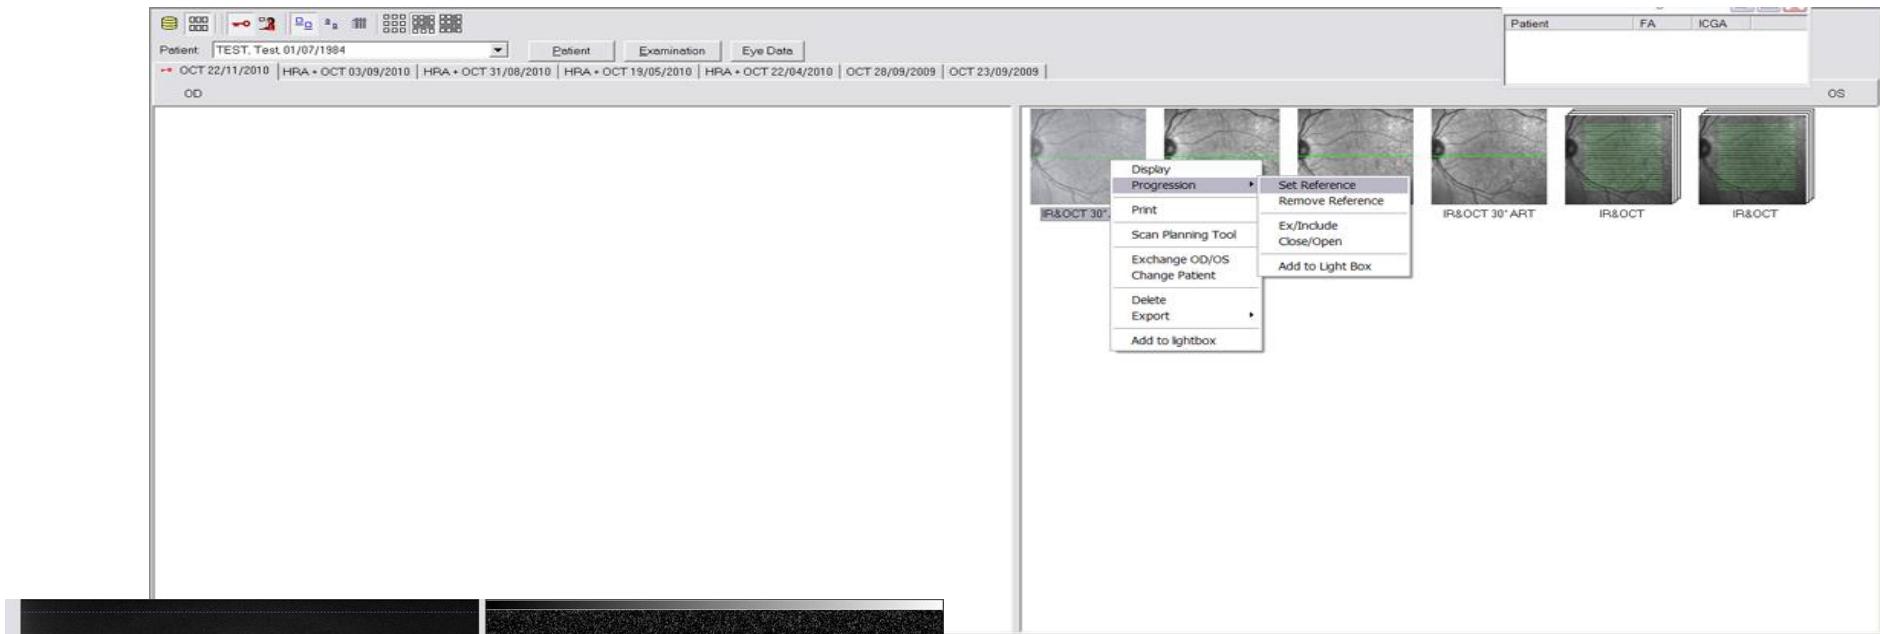

1. Après avoir entré les paramètres pour le 1er examen
2. Restez appuyé sur l'icône « Custom »
3. Puis renommer l'icône

4. Faire la même chose pour chaque examen
5. Ainsi tous les examens seront personnalisés

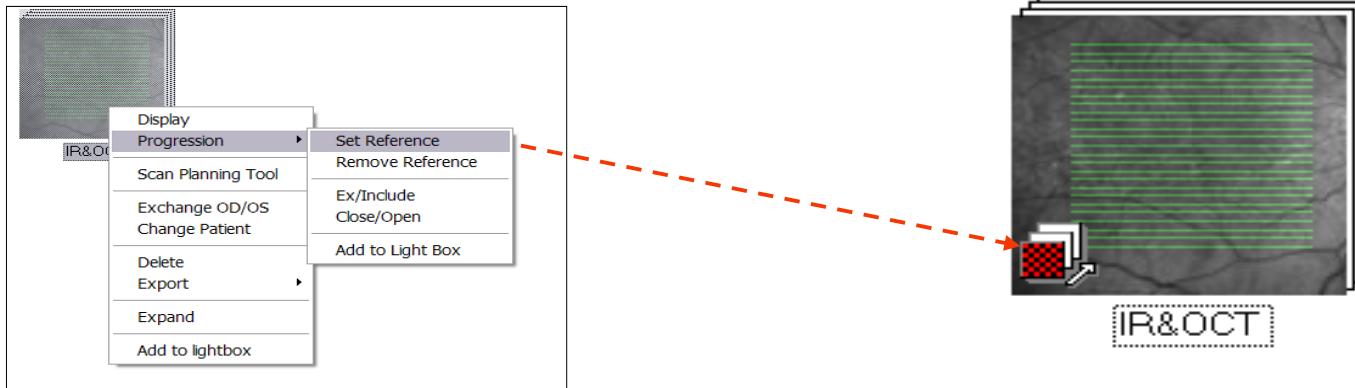

The bottom portion of the interface includes a "Select Baseline Examination" dialog box. It shows two options: "OD" and "OS", with "OS" selected. Below the dialog, a detailed "Setting" section provides specific parameters: Sens.: 59, Power: IR 100%, Mode: OCT Section, Rate: 4.7/sec, Res.: High Res. The "Memory" section indicates 0 images free and 999 MB available. Buttons for "OK" and "Cancel" are at the bottom of the dialog.

Below the dialog is the main OCT control panel. It features a large preview window showing a dark, textured image of the retina. Below the preview are buttons for "Duality: R" and "Application: Retina". The "Preset" section includes icons for Fast, Depth, Delay, P-Mode, X-Mode, Map16x, Scan, and Custom. The "OCT Control" section has buttons for Follow-Up, OCT Control (with icons for Q, EDI), and Scan (with icons for ART, O, \*). The "Scan" settings show "ART 100 frames" and "1536 A-scans". The "OCT" status bar at the bottom shows "ART / Live" and "HR OCT". The Heidelberg Engineering logo is at the bottom right.

This screenshot shows a medical imaging software interface for eye exams. At the top, there are tabs for 'Tous les examens' (All exams), 'Répéter la dernière visite' (Repeat last visit), 'Rétine' (Retina), 'AngioPlex', 'Glaucome', 'Segment antérieur' (Anterior segment), and 'Examen de l'état physique'. Below these are lists of specific exam protocols: 'Montage Angio 6x6 mm', 'Montage Angio 8x8 mm', 'ONH Angiography 4.5x4.5 mm', 'HD 1 Line 100x', 'HD 21 Line' under the 'Tous les examens' tab; and 'Anterior Segment Cube 512x128', 'Angiography 3x3 mm', 'Angiography 6x6 mm', 'Angiography 8x8 mm', 'Montage Angio 6x6 mm' under the 'Segment antérieur' tab.

The main area features two circular planning tools. The top one has labels 'ST', 'SN', 'C', 'IT', and 'IN' with 'C' highlighted in blue. The bottom one is a crosshair targeting tool. To the right of these are four preview windows: 'Améliorer' (top-left), 'Centre' (top-right), 'Mise au point automatique' (bottom-left), and 'Capturer' (bottom-right). The 'Capturer' window contains a red-bordered 'Capturer' button. Navigation icons like arrows and a magnifying glass are scattered throughout the interface.

# OCT/OCTA Artéfacts

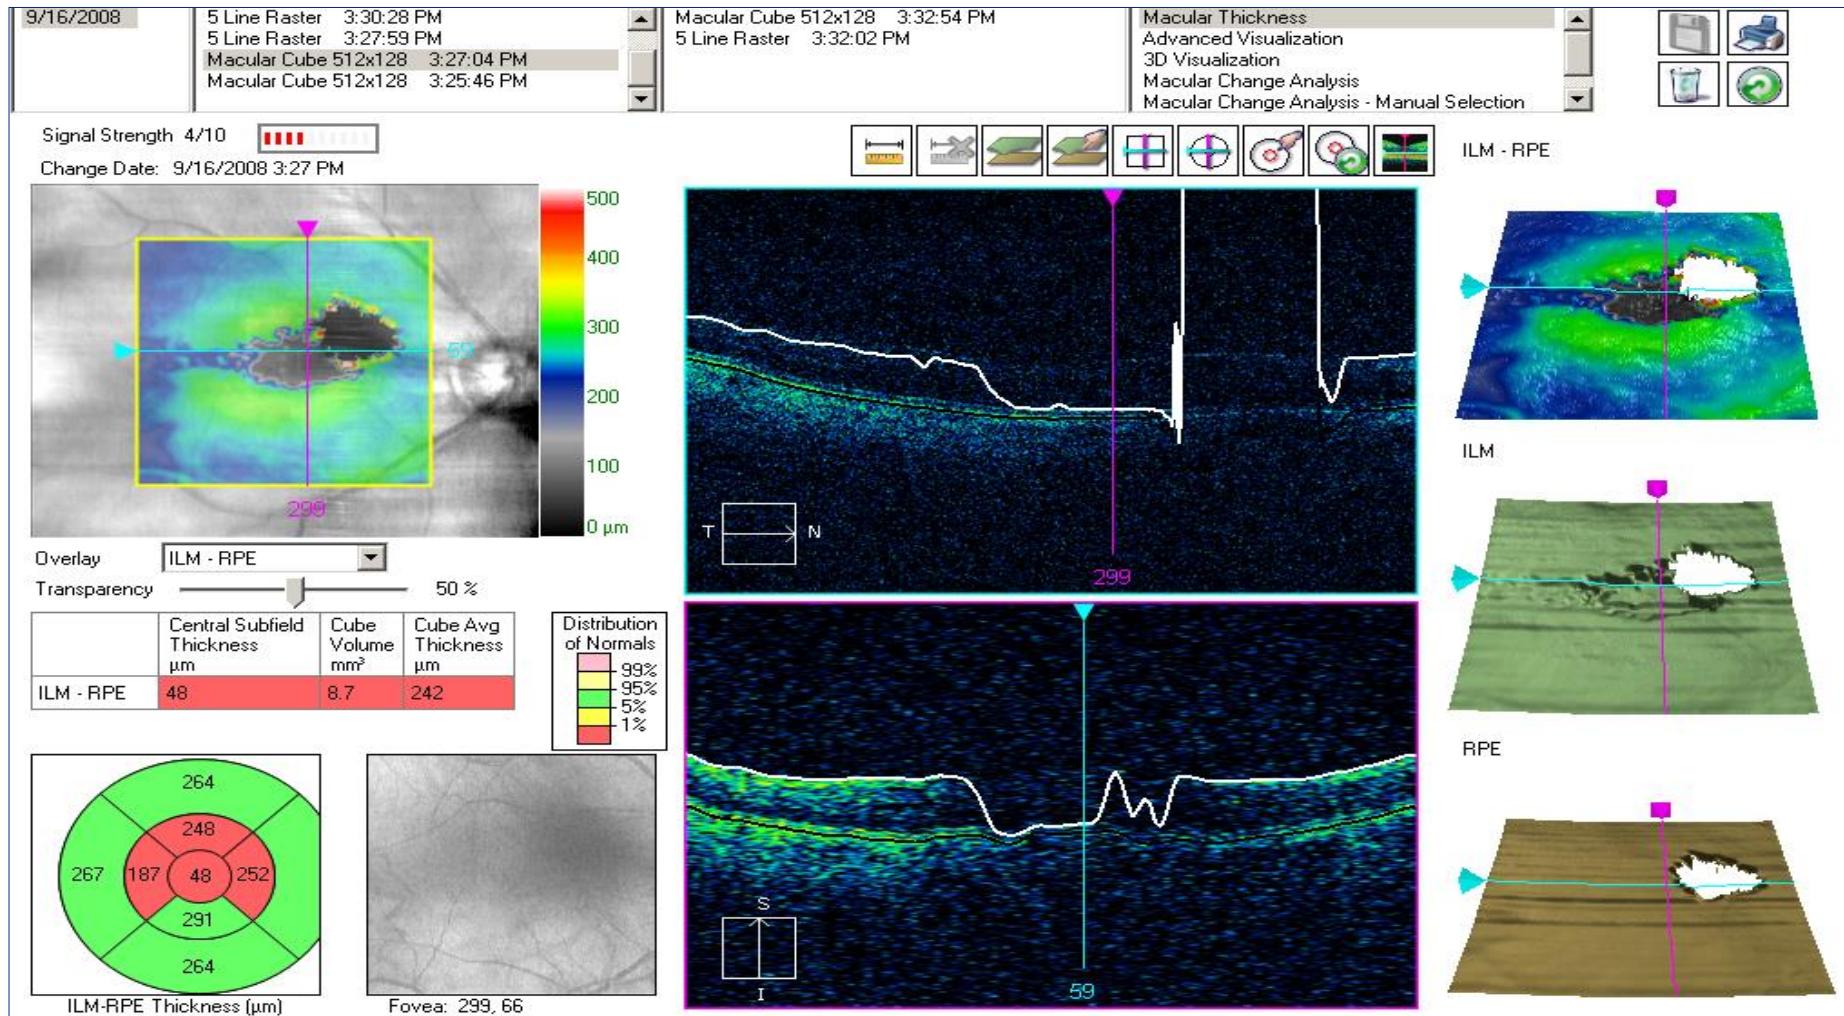

Les artefacts peuvent avoir une origine triple

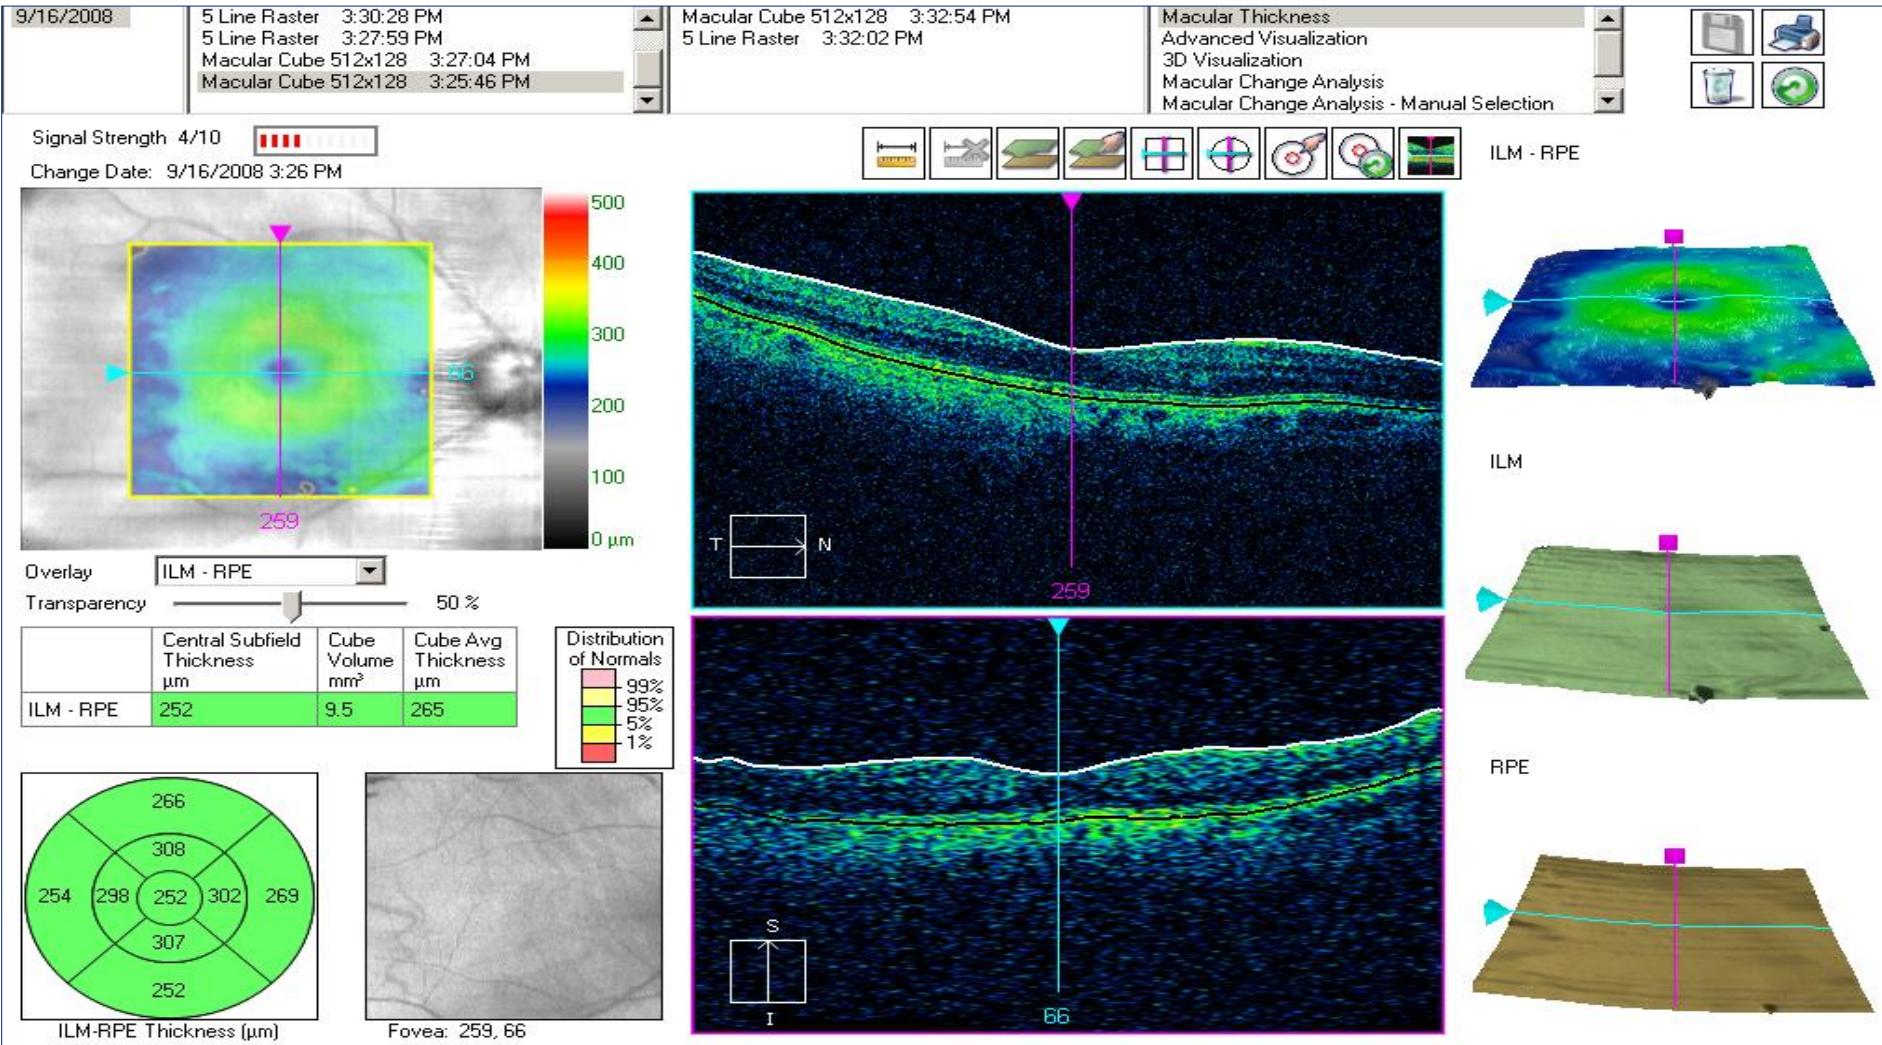

- ✓ Liés au patient:
  - trouble des milieux (cataractes, hémorragies intra vitréennes / sous rétianniennes, corps flottants )
  - mouvements oculaires
  - mauvaise fixation...
- ✓ Liés à l'opérateur (l'acquisition):
  - mauvais positionnement du scan et/ou du choix de protocole d'examen
- ✓ Liés à l'appareil et au logiciel de traitement d'image:
  - erreurs de mesure de l'épaisseur , sommations, eye tracking, segmentation ...

# OCTA & Artéfacts

## Displacement artifact: artefact de déplacement

Provoqué par les mouvements oculaires pendant le scan. L'image en face semble discontinue le long de la direction du B-scan.

## False-negativ flow : fausse absence de flux

Les signaux OCTA avec une décorrélation basse suggèrent l'absence de flux, alors que le flux existe réellement. La décorrélation peut être trop faible au cours de l'intervalle mesurant le flux, pour mettre en évidence ce flux. Une atténuation du signal pouvant être lié à des opacités des milieux peut aussi entraîner des faux négatifs. (exemple : μanévrismes)

## False positive flow : fausse présence de flux

Un signal OCTA avec une forte décorrélation suffit à montrer un flux dans des situations où il n'y en a pas, ou peu. Ceci peut être du bruit au niveau de l'image ou à des microsaccades oculaires. (exemple: exsudats)

## Projection artifact : artefacts de projection

L'un des plus importants artéfacts en OCTA. La lumière incidente sur un vaisseau sanguin peut être réfléchie en arrière, ou dispersée, ou réfractée. La lumière qui passe à travers le vaisseau fluctue au cours du temps et n'importe quelle structure en arrière du vaisseau peut être « illuminée » par cette lumière fluctuante. Les techniques utilisant le contraste des mouvements détectent les fluctuations au cours du temps, donc des images artéfactuelles des vaisseaux peuvent être vues à des localisations plus profondes dans l'œil que leur réelle position.

## Gap defect : lacunes

Une perte d'information au niveau d'une région de l'image, résultant d'un mouvement oculaire, peut exister dans les données de l'image brute, ou dans les images traitées par le logiciel (correction des mouvements oculaires).

## Segmentation artifact : artefact de segmentation

# IMAGE ARTIFACTS IN OPTICAL COHERENCE TOMOGRAPHY ANGIOGRAPHY

RICHARD F. SPAIDE, MD,<sup>\*</sup> JAMES G. FUJIMOTO, PhD,<sup>†</sup> NADIA K. WAHEED, MD<sup>‡</sup>

**Purpose:** To describe image artifacts of optical coherence tomography (OCT) angiography and their underlying causative mechanisms. To establish a common vocabulary for the artifacts observed.

**Methods:** The methods by which OCT angiography images are acquired, generated, and displayed are reviewed as are the mechanisms by which each or all of these methods can produce extraneous image information. A common set of terminology is proposed and used.

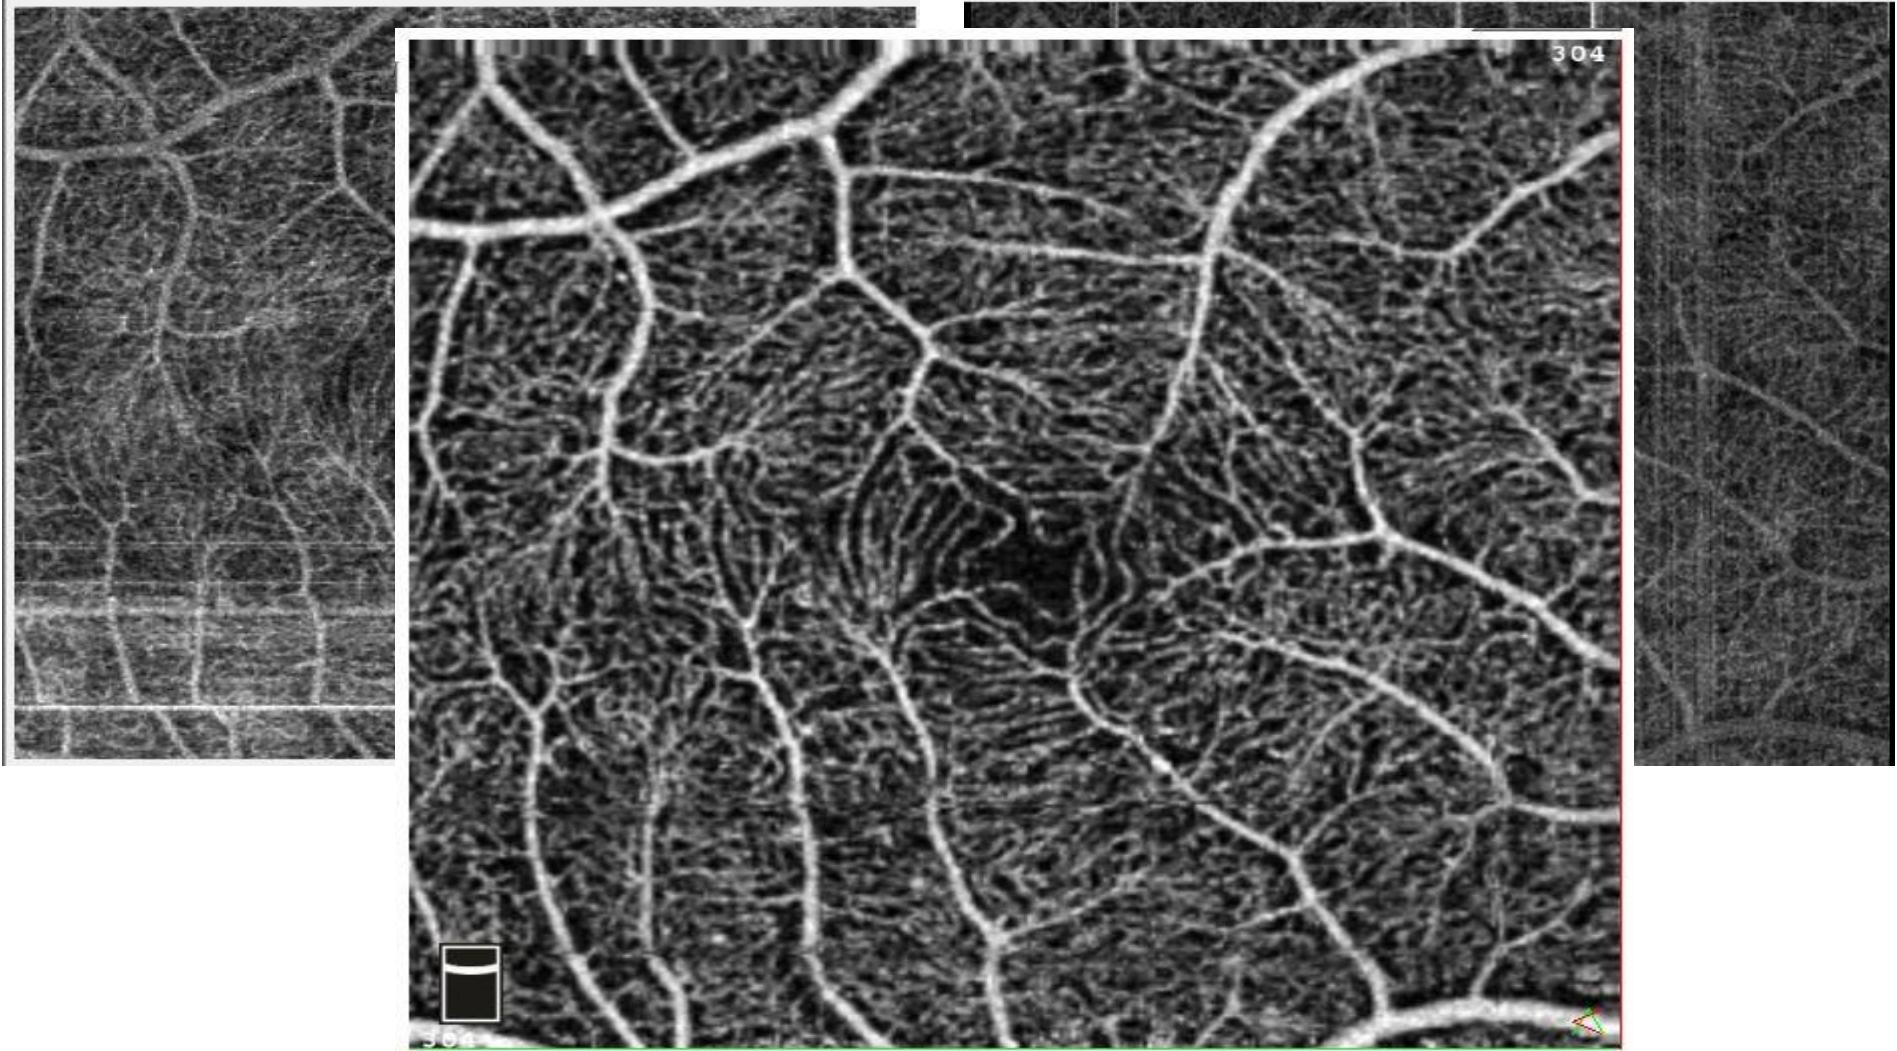

**Results:** Optical coherence tomography angiography uses motion contrast to image blood flow and thereby images the vasculature without the need for a contrast agent. Artifacts are very common and can arise from the OCT image acquisition, intrinsic characteristics of the eye, eye motion, image processing, and display strategies. Optical coherence tomography image acquisition for angiography takes more time than simple structural scans and necessitates trade-offs in flow resolution, scan quality, and speed. An important set of artifacts are projection artifacts in which images of blood vessels seem at erroneous locations. Image processing used for OCT angiography can alter vascular appearance through segmentation defects, and because of image display strategies can give false impressions of the density and location of vessels. Eye motion leads to discontinuities in displayed data. Optical coherence tomography angiography artifacts can be detected by interactive evaluation of the images.

**Conclusion:** Image artifacts are common and can lead to incorrect interpretations of OCT angiography images. Because of the quantity of data available and the potential for artifacts, physician interaction in viewing the image data will be required, much like what happens in modern radiology practice.

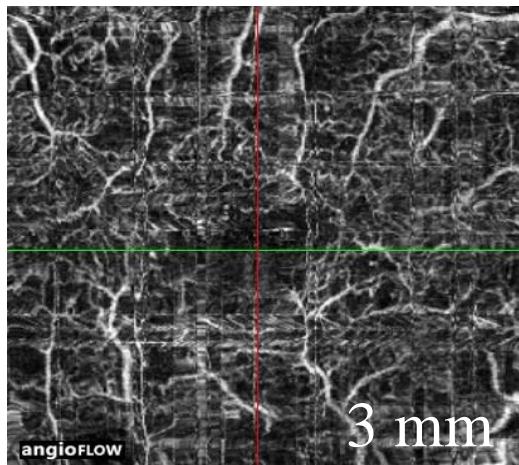

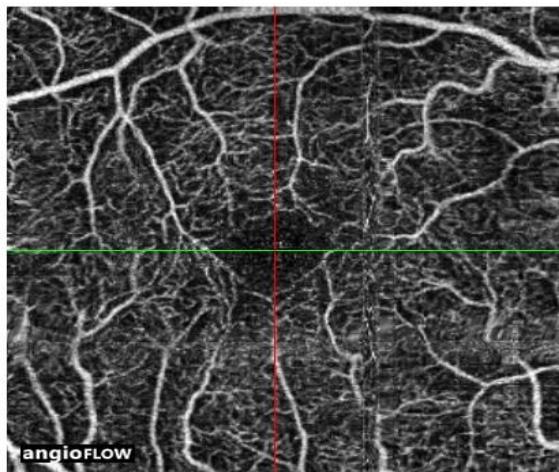

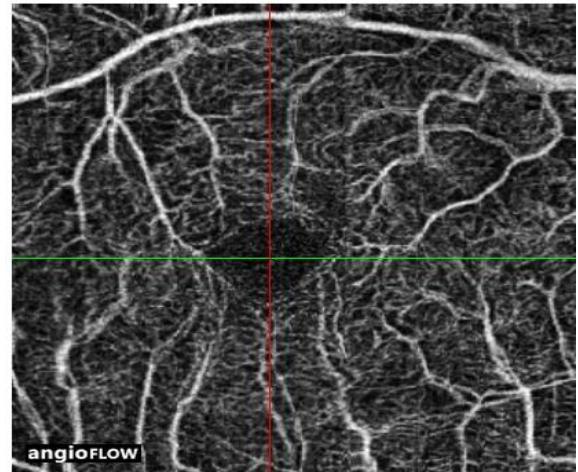

RETINA 35:2163–2180, 2015

The artefacts are more frequent in eyes with pathology.  
They should be known and avoided.

## Hémorragies

The vast majority of soft drusen produce shadowing artifacts in the structural en-face OCT CC images that allow neither a qualitative nor a quantitative flow evaluation under drusen in SD OCT-A.

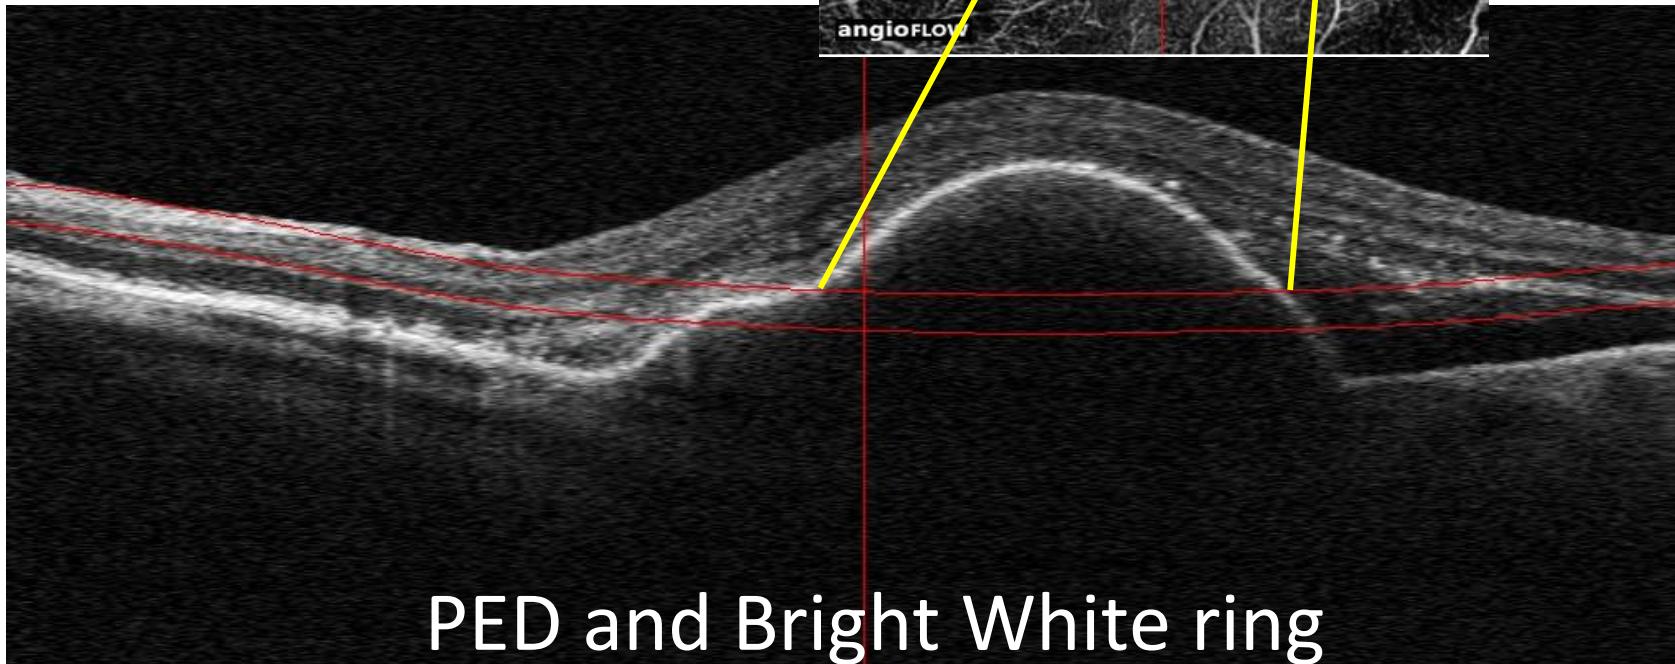

### Signal reduction in choriocapillaris and segmentation errors in spectral domain OCT angiography caused by soft drusen

## Optical coherence tomography angiography artifacts in retinal pigment epithelial detachment

*A practical guide to optical coherence tomography angiography interpretation*  
Greig et al. International Journal of Retina and Vitreous, 2020

**OCTA Interpretation Toolkit.** How to apply step-by-step OCTA interpretation toolkit in a patient with AMD.

**Step 1: Image the right spot.** Color fundus photograph of a patient with known AMD, the macula was selected as the area of interest and imaged.

**Step 2: Look at the en face OCTA images.**  $3 \times 3$  mm en face projections of each the full retinal depth, the avascular slab and the choriocapillaris (from left to right). The avascular and choriocapillaris slabs should be assessed in this AMD patient to check for presence of MNV. Note clearly defined vascular structures in the choriocapillaris slab (right most image), this is concerning for a type 1 MNV.

**Step 3: Look at the segmentation lines.** Segmentation is assessed at multiple points throughout the slab to ensure accuracy.

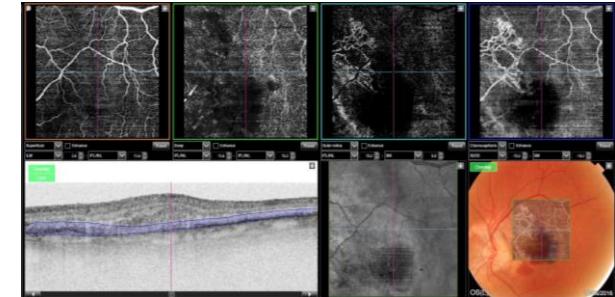

**Step 4: Look at the B-scan with flow overlay.** B-scan through lesion shows clear flow below the RPE (white arrow) and no projection artifact from overlying vasculature, suggesting this is in fact an MNV.

**Step 5: Look at the en face intensity image.** En face intensity image for the choriocapillaris slab shows strong signal, shadowing artifact is not expected to disrupt image interpretation.

**Summary:** Methodical OCTA image analysis uncovered a type 1 MNV that was not visible on fundus examination or on full depth retinal projection

# Conclusion

- Bonne compréhension des artefacts existants
- En corrélation avec l'imagerie multimodale
- La visualisation combinée des images OCTA et OCT (B-scans, en-face, lignes de segmentation) devrait réduire considérablement le risque de mauvaise interprétation tout en fournissant des informations plus complètes sur les pathologies rétiniennes.
- Les améliorations apportées aux logiciels informatiques automatisés pour la segmentation anatomique, la détection pathologique et la quantification rendront OCTA plus facile à utiliser

# Merci de votre attention
